

Modul 4: Network Infrastructure Fundamenatls

Lesson 1: IPv4 Fundamentals

IPv4 Fundamentals

Overview of IPv4 settings

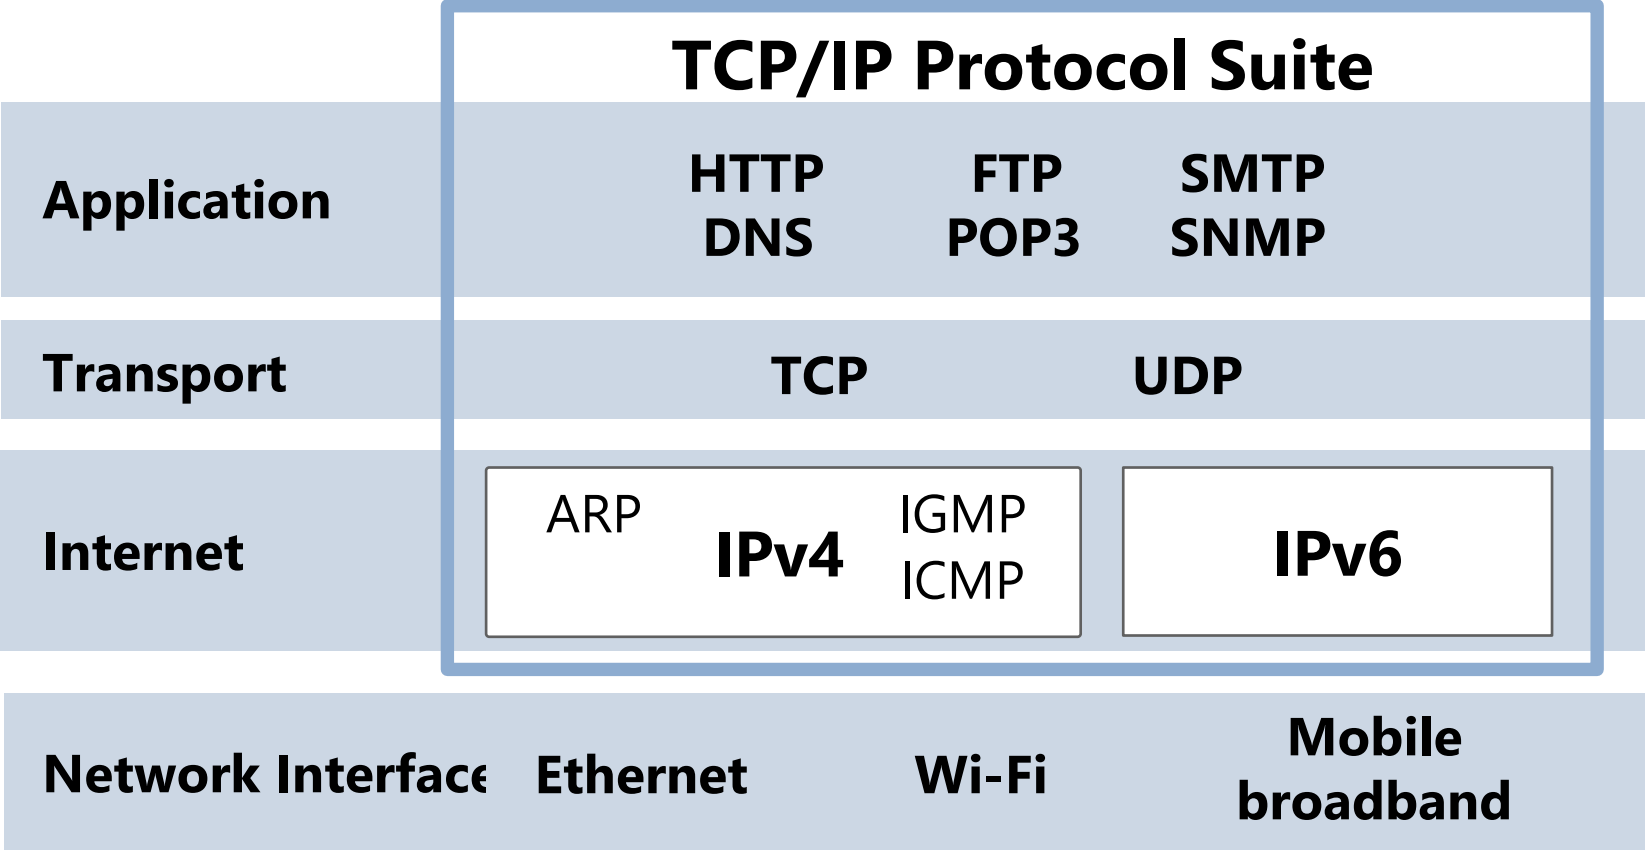

Defining Subnets

Public, private and APIPA addresses

The TCP/IP Protocol Suite

Protocols in the TCP/IP Suite

OSI	TCP/IP	TCP/IP Protocol Suite		
Application Presentation Session	Application	HTTP FTP SMTP	DNS POP3 SNMP	
Transport	Transport	TCP	UDP	
Network	Internet	ARP IPv4 IGMP ICMP	IPv6	
Data Link Physical	Network Interface	Ethernet	Wi-Fi	Mobile broadband

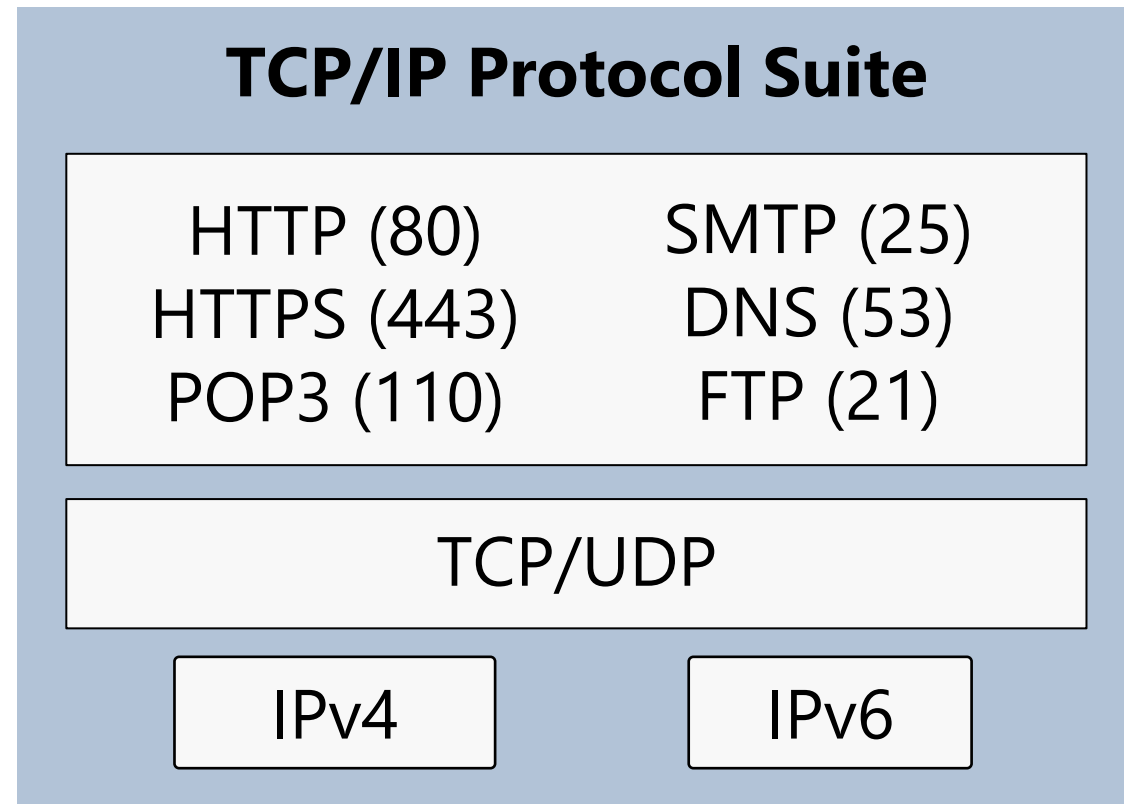

TCP/IP Applications

Some common application layer protocols:

- HTTP
- HTTPS
- FTP
- RDP
- SMB
- SMTP
- POP3

What Is a Socket?

A socket is a combination of an IP address, a transport protocol, and a port

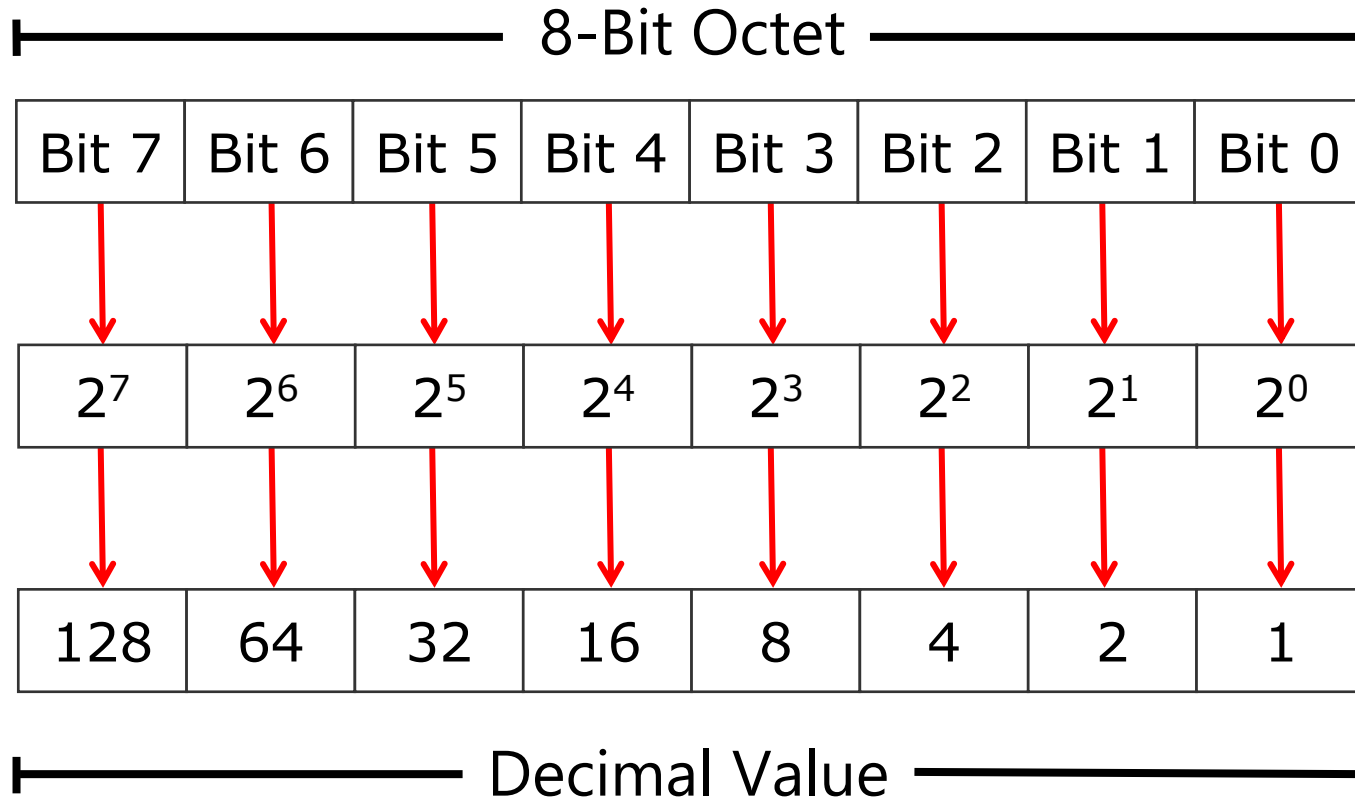

IPv4 Addressing

- Each networked computer must be assigned a unique IPv4 address
- Network communication for a computer is directed to the IPv4 address of the computer
- Each IPv4 address contains:
 - Network ID, identifying the network
 - Host ID, identifying the computer
- The subnet mask identifies which part of the IPv4 address is the network ID (255) and which is the host ID (0)

IPv4 Addressing

IP address	172	16	0	10
Subnet mask	255	255	0	0
Network ID	172	16	0	0
Host ID	0	0	0	10

IPv4 Addressing

Public, private, and APIPA addresses

Public

- Required by devices and hosts that connect directly to the Internet
- Must be globally unique
- Routable on the Internet
- Must be assigned by IANA/RIR

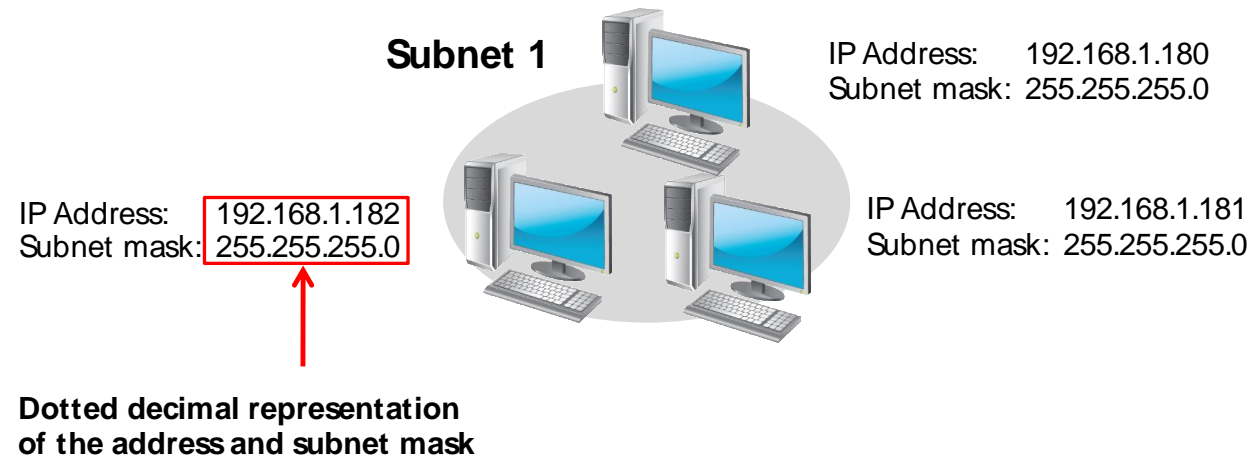

Private

- Not routable on the Internet
 - 10.0.0.0/8
 - 172.16.0.0/12
 - 192.168.0.0/16
- Can be assigned locally by an organization
- Must be translated to access the Internet

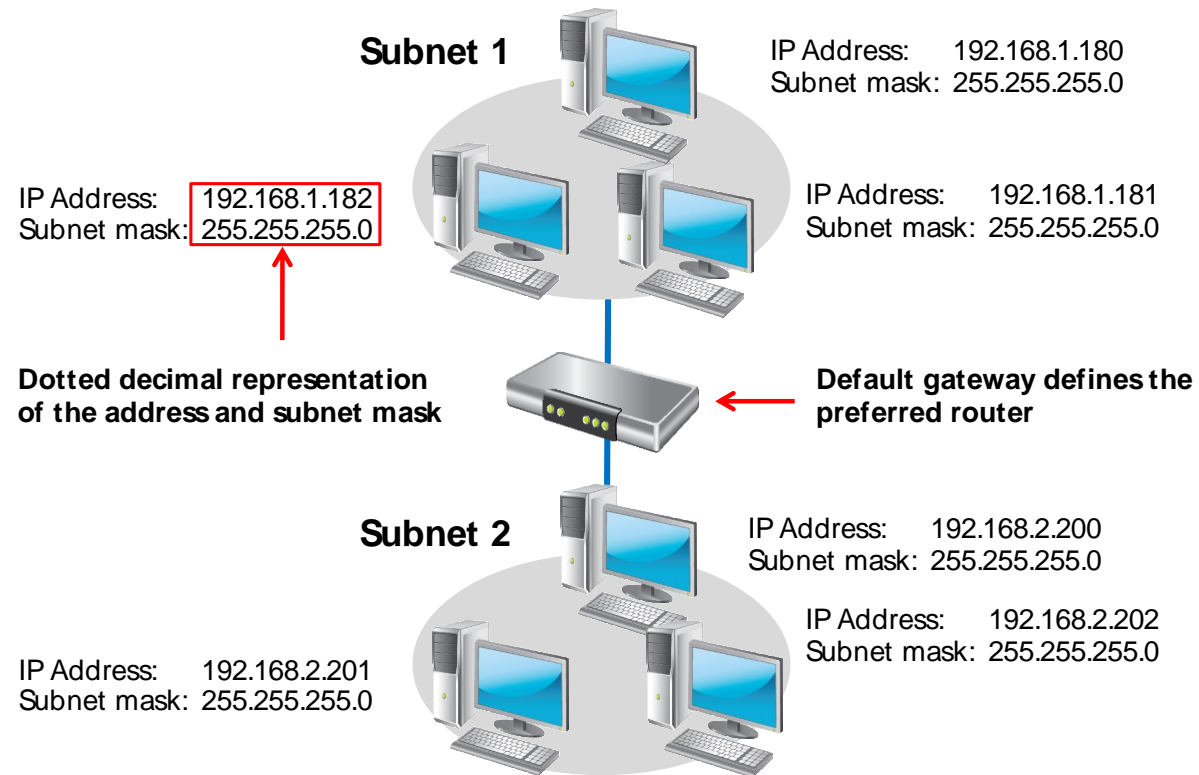

IPv4 Addressing

An IPv4 configuration identifies a computer to other computers on a network

IPv4 Addressing

An IPv4 configuration identifies a computer to other computers on a network

The Benefits of Using Subnetting (1 of 2)

When you subdivide a network into subnets, you create a unique ID for each subnet that is derived from the main network ID

The Benefits of Using Subnetting (2 of 2)

- By using subnets, you can:
 - Use a single network address across multiple locations
 - Reduce network congestion by segmenting traffic
 - Increase security by using firewalls
 - Overcome limitations of current technologies

Lesson 2: IPv6 Fundamentals

IPv6 Fundamentals

Overview of IPv4 addressing

Overview of IPv6 addressing

- 128-bit address in binary:

```
001000000000000010000110110111000
0000000000000000000010110101001100
000000011100110000000000011011101
00010001001000100001001000110100
```

- 128-bit address divided into 16-bit blocks:

```
0010000000000001 0000110110111000
0000000000000000 0010110101001100
0000000111001100 0000000011011101
0001000100100010 0001001000110100
```

- Each 16-bit block converted to hexadecimal (base 16):

```
2001:0DB8:0000:2D4C:01CC:00DD:1122:1234
```

- Further simplified by removing leading zeros:

```
2001:DB8:0:2D4C:1CC:DD:1122:1234
```

Overview of IPv6 addressing

[0010][1101][0100][1100]

8 4 2 1

[0 0 1 0]

0+0+2+0=2

[1 1 0 1]

8+4+0+1=D

[0 1 0 0]

0+4+0+0=4

[1 1 0 0]

8+4+0+0=C

= 2D4C

IPv6 address structure

- The number of network bits is defined by the prefix
- Each host has 64 bits allocated to the interface identifier

Type of address	IPv4 address	IPv6 address
Unspecified	0.0.0.0	::
Loopback	127.0.0.1	::1
Autoconfigured	169.254.0.0/16	FE80::/64
Broadcast	255.255.255.255	Uses multicasts instead
Multicast	224.0.0.0/4	FF00::/8

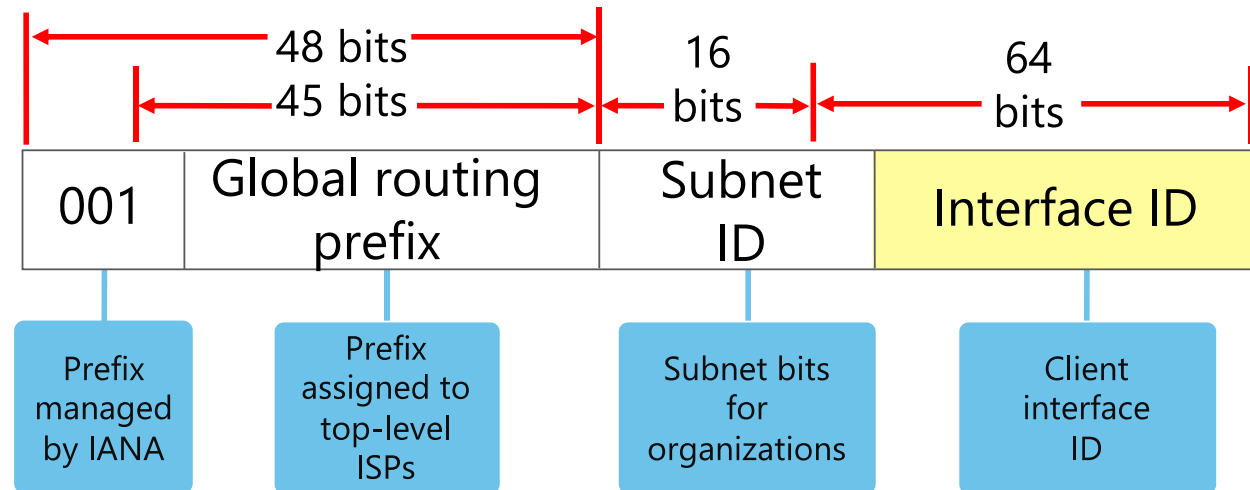

Types of IPv6 addresses

- The following are types of unicast IPv6 addresses:
 - Global unicast addresses
 - Unique local addresses
 - Link-local addresses
 - Site-local addresses:
 - Formerly deprecated in RFC 3879
 - Superseded by unique local addresses
 - Special addresses
 - Compatibility or transition addresses

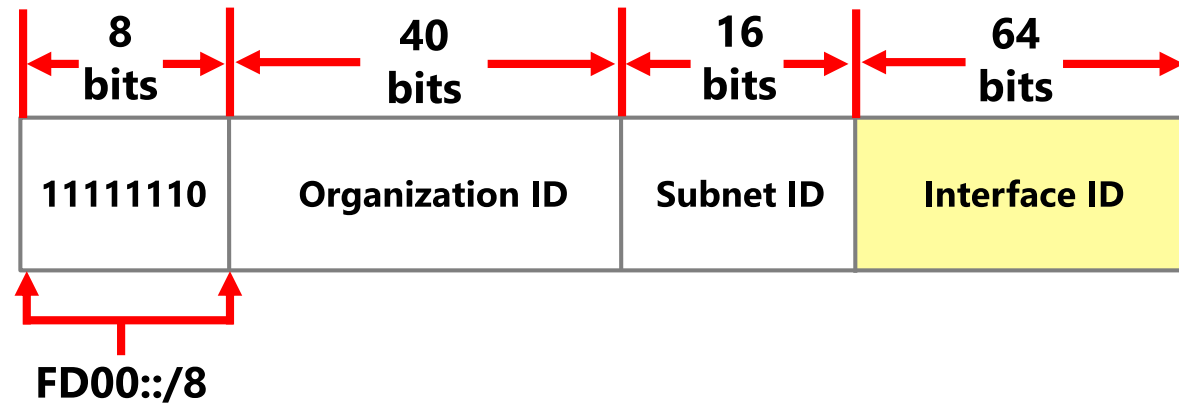

Types of IPv6 addresses

- Global unicast addresses:
 - Are routable on the IPv6 Internet
 - Allocate 16 bits for internal subnetting
 - Begin with 2 or 3 (2000::/3)

Types of IPv6 addresses

- Unique local addresses:
 - Are equivalent to IPv4 private addresses
 - Require the organization ID to be randomly generated
 - Allocate 16 bits for internal subnetting

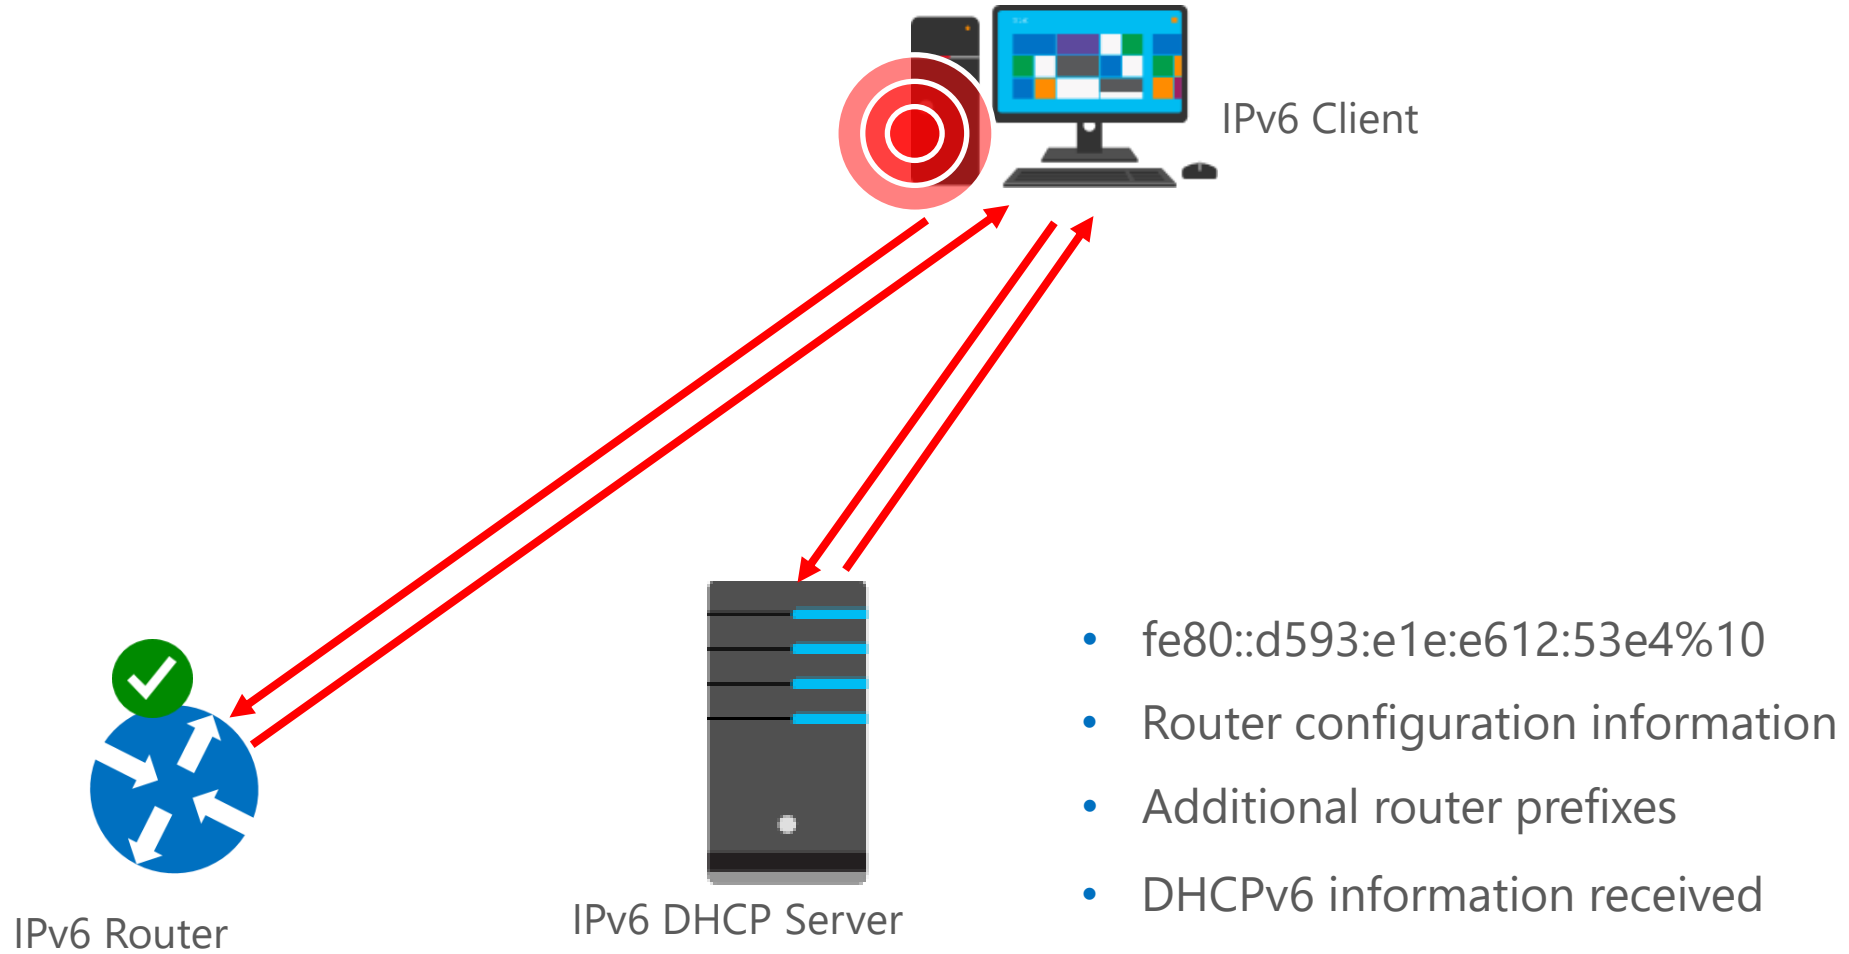

Types of IPv6 addresses

- Link-local addresses:
 - Are automatically generated on all IPv6 hosts
 - Are similar to IPv4 APIPA addresses
 - Are sometimes used in place of broadcast messages
 - Include a zone ID that identifies the interface
- Examples:
 - fe80::2b0:d0ff:fee9:4143%3
 - fe80::94bd:21cf:4080:e612%2

IPv6 Auto configuration

1 Derive Link-Local Address

Lesson 3: Dynamic Host Configuration Protocol (DHCP)

Dynamic Host Configuration Protocol (DHCP)

Benefits of using DHCP

How DHCP allocates addresses

How DHCP lease generation works

How DHCP lease renewal works

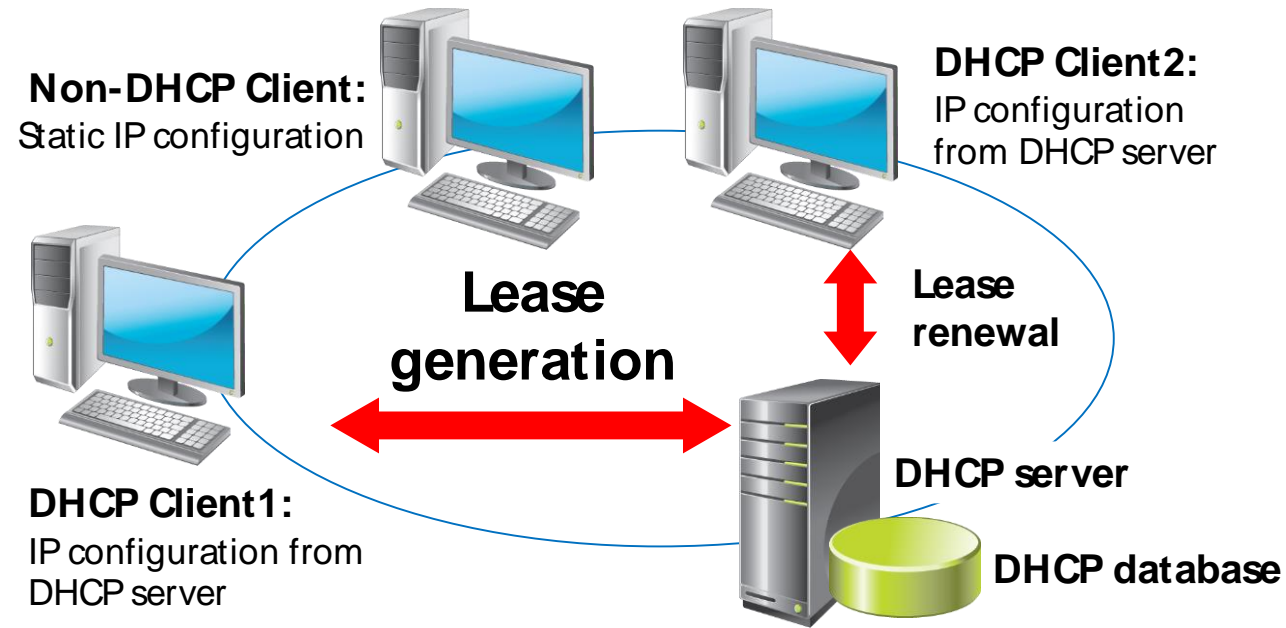

DHCP scope and options

Benefits of Using DHCP

DHCP reduces the complexity and amount of administrative work by using automatic IP configuration

Automatic IP Configuration	Manual IP Configuration
IP addresses are supplied automatically	IP addresses are entered manually
Correct configuration information is ensured	IP address could be entered incorrectly
Client configuration is updated automatically	Communication and network issues can result
A common source of network problems is eliminated	Frequent computer moves increase administrative effort

How DHCP Allocates IP Addresses

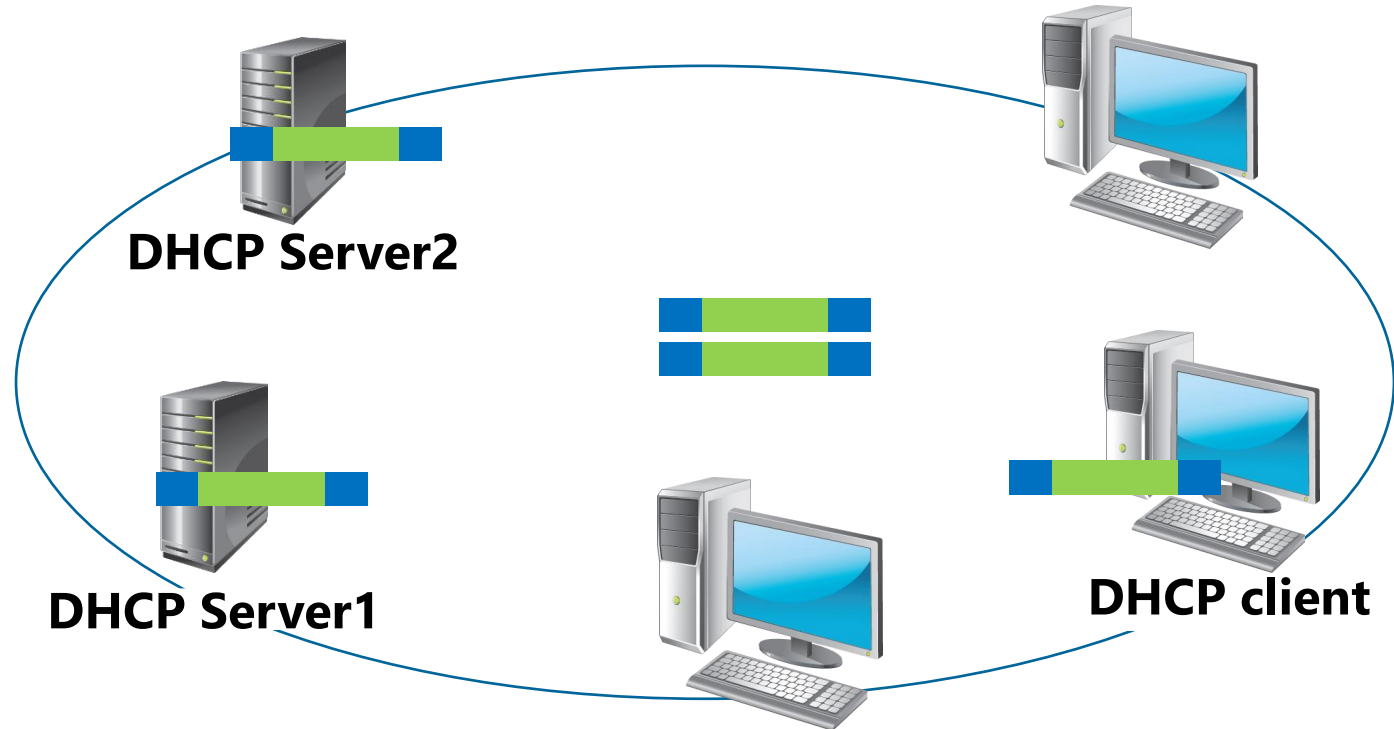

IP Address1: Leased to DHCP Client1

IP Address2: Leased to DHCP Client2

IP Address3: Available for lease

How DHCP Allocates IP Addresses

1. DHCP client broadcasts a DHCPDISCOVER packet
2. DHCP servers broadcast a DHCPOFFER packet
3. DHCP client broadcasts a DHCPREQUEST packet
4. DHCP Server1 broadcasts a DHCPACK packet

How DHCP Allocates IP Addresses

1. DHCP client sends a DHCPREQUEST packet
2. DHCP Server1 sends a DHCPACK packet
3. If the client fails to renew its lease after 50% of the lease duration has expired, the DHCP lease renewal process begins again after 87.5% of the lease duration has expired
4. If the client fails to renew its lease after 87.5% of the lease has expired, the DHCP lease generation process starts over again with a DHCP client broadcasting a DHCPDISCOVER

DHCP scope and options

- A DHCP scope is a range of IP addresses that are available to be leased
- DHCP scope properties include:
 - Network ID
 - Lease duration
 - Scope name
 - Subnet mask
 - Network IP address range
 - Exclusion range

DHCP scope and options

- You must create scopes to define the network information that will be distributed to clients
- A scope must contain:
 - A range of IP addresses
 - A subnet mask
 - A lease duration
- A scope might contain:
 - Default gateway address
 - DNS server and suffix
 - Other network options
- IP addresses can be reserved based on the MAC address of the client network interface

DHCP scope and options

- DHCP options:
 - Are values for common configuration data
 - Can be applied to the server, scope, class, and reservation level
- Common scope options include:
 - Router (Default gateway)
 - DNS domain name
 - DNS servers

Lesson 4: Domain Name Service (DNS)

Domain Name Service (DNS)

How does DNS name resolution work?

DNS components

What are DNS zones and records?

Tools and techniques for troubleshooting name resolution

How does DNS name resolution work?

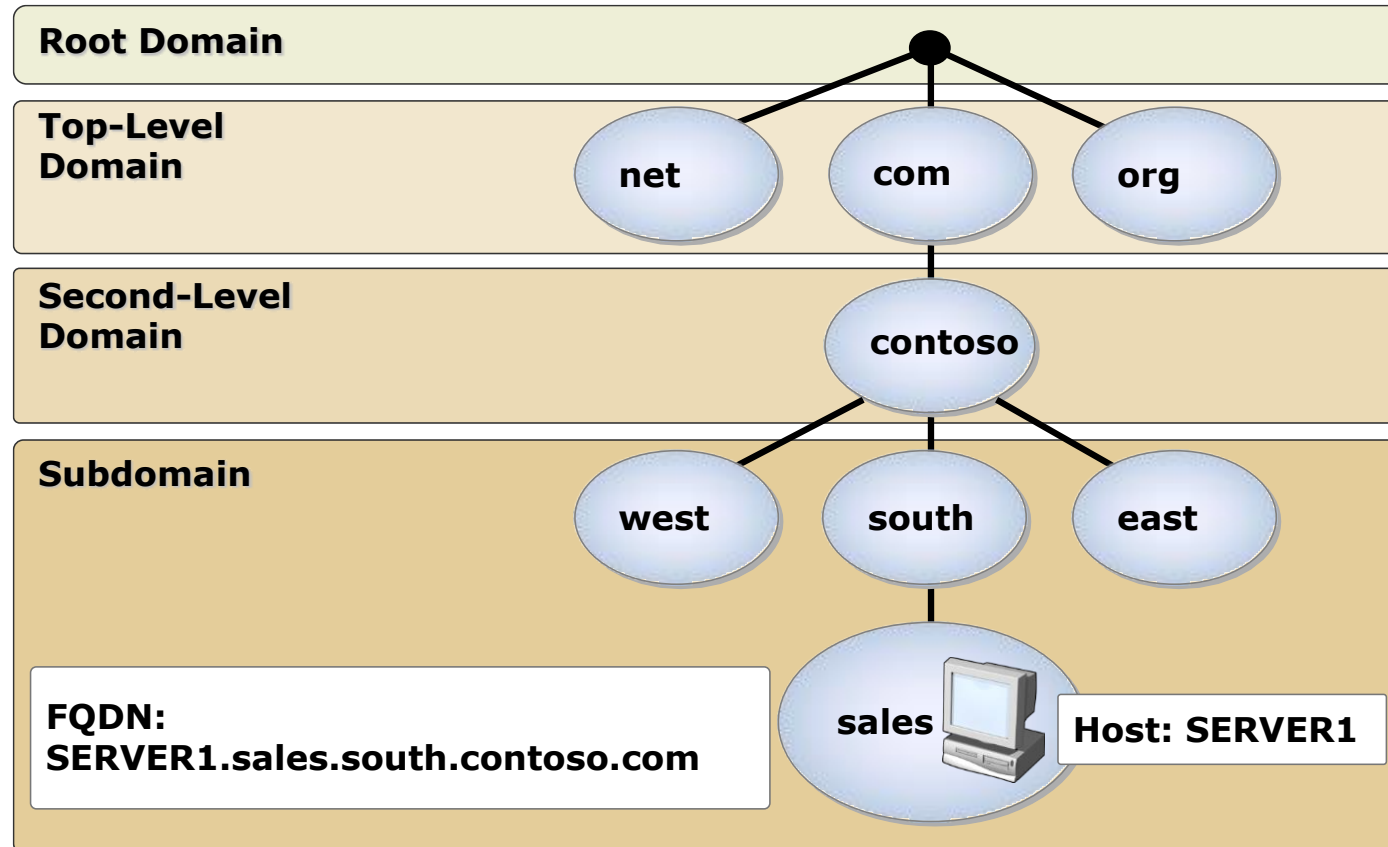

A *hostname* is a computer name that is added to a domain name and top level domain to make a fully qualified domain name (FQDN)

Fully qualified domain name = AcctDirPC.contoso.com

NetBIOS names are rarely used and are being deprecated in Windows operating systems

How does DNS name resolution work?

DNS components

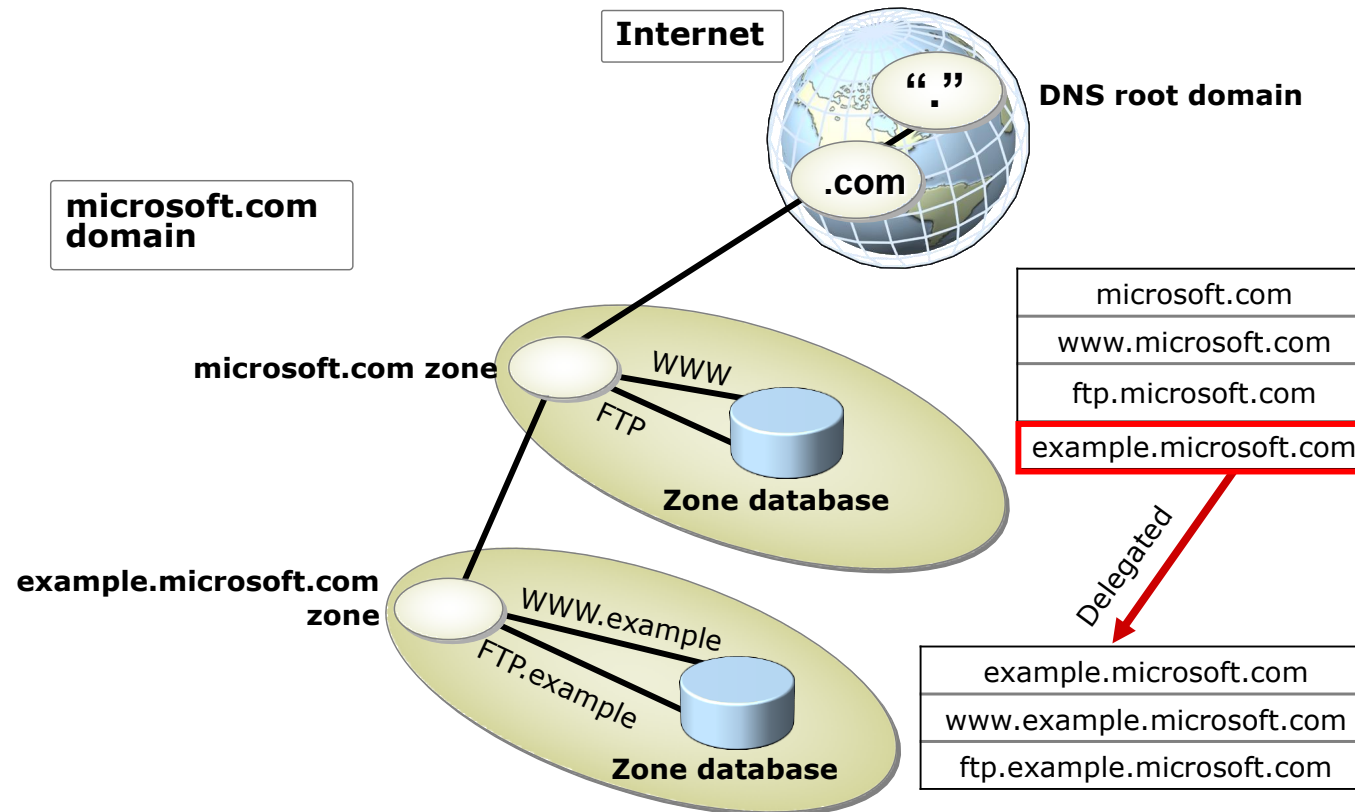

What are DNS zones and records?

DNS resource records include:

- **SOA: Start of Authority**
- **A: Host Record**
- **CNAME: Alias Record**
- **MX: Mail Exchange Record**
- **SRV: Service Resources**
- **NS: Name Servers**
- **AAAA: IPv6 DNS Record**
- **PTR: Pointer Record**

What are DNS zones and records?

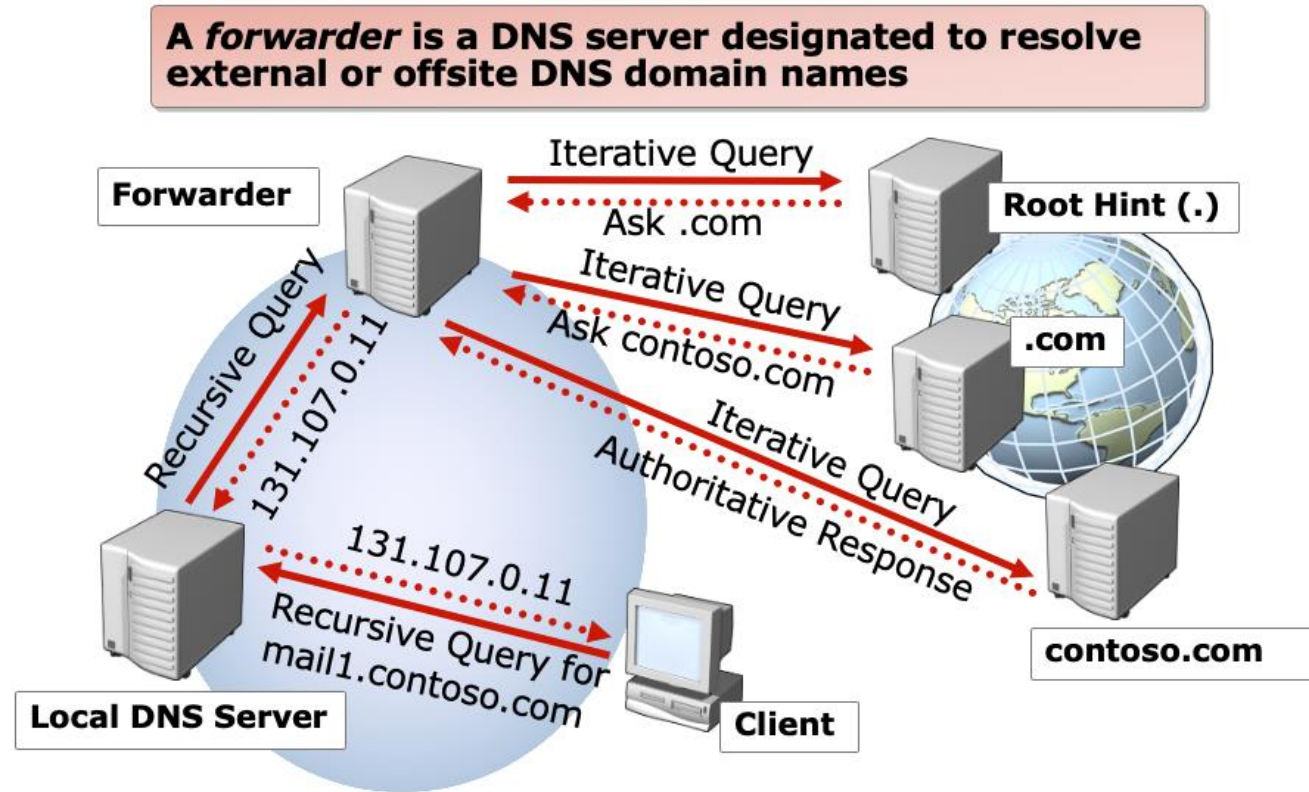

What are DNS zones and records?

Zones	Description
Primary	Read/write copy of a DNS database
Secondary	Read-only copy of a DNS database
Stub	Copy of a zone that contains only records used to locate name servers
Active Directory–integrated	Zone data is stored in AD DS rather than in zone files

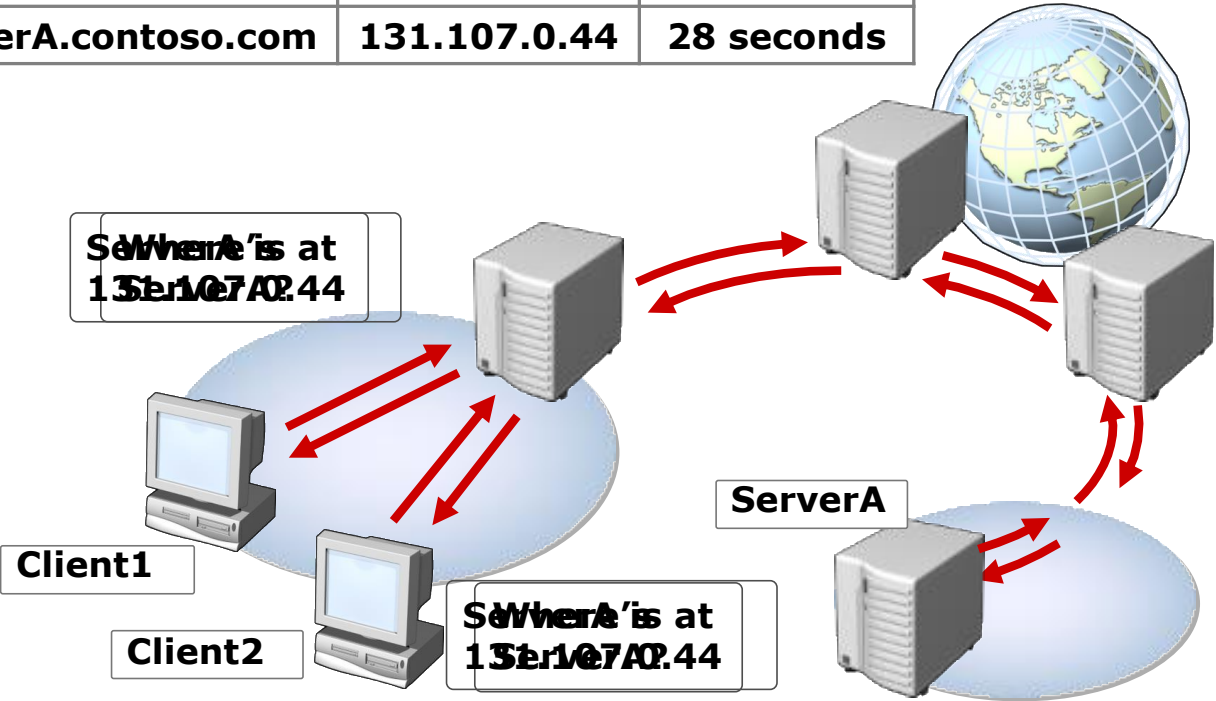

What are DNS zones and records?

What are DNS zones and records?

DNS server cache		
Host name	IP address	TTL
ServerA.contoso.com	131.107.0.44	28 seconds

Tools and techniques for troubleshooting name resolution

- Command-line tools to troubleshoot configuration issues:
 - Nslookup
 - DNSCmd
 - DNSlint
 - Ipconfig
- PowerShell:
 - Get-DnsClientServerAddress
 - Clear-DnsClientCache
 - Resolve-DnsName
 - Register-DnsClient

Tools and techniques for troubleshooting name resolution

- The troubleshooting process:
 - Identify client DNS server with nslookup or Resolve-DnsName
 - Communicate via ping
 - Use nslookup to verify records

Lesson 4: Azure network Fundamentals

Azure network Fundamentals

Plan Virtual Networks

Create Subnets

Create Virtual Networks

Plan IP Addressing

Create Public IP Addresses

Associate Public IP Addresses

Associate Private IP Addresses

Plan Virtual Networks

Logical representation
of your own network

Create a dedicated
private cloud-only
virtual network

Securely extend
your datacenter with
virtual networks

Enable hybrid
cloud scenarios

Create Virtual Networks

Create new virtual networks
at any time

Add virtual networks when
you create a virtual machine

Need to define the address space,
and at least one subnet

Be careful with overlapping address
spaces

Create virtual network

Create Subnets

+ Subnet	+ Gateway subnet	Refresh	Manage users	Delete
Name ↑↓	IPv4 ↑↓	IPv6 ↑↓	Available IPs ↑↓	Delegated
subnet0	10.0.0.0/24	-	250	-
subnet1	10.0.1.0/24	-	251	-
subnet2	10.0.2.0/24	-	251	-
AzureBastionSubnet	10.0.30.0/27	-	27	-
GatewaySubnet	10.0.3.0/27	-	availability dependent on dynamic use	-

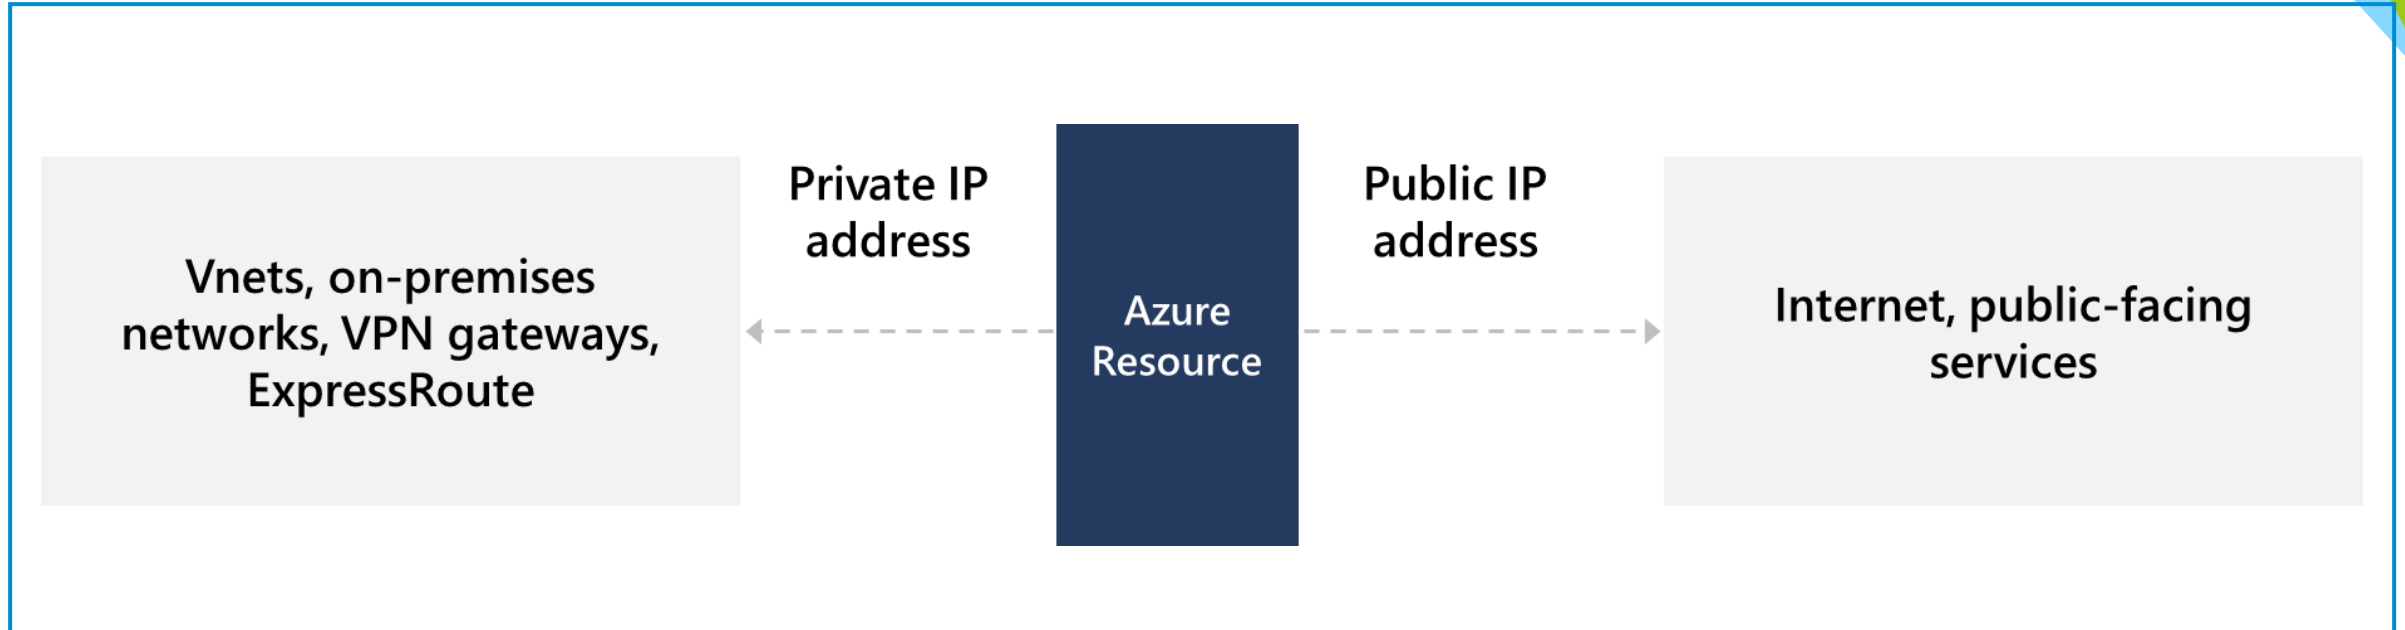

A virtual network can be segmented into one or more subnets

Subnets provide logical divisions within your network

Subnets can help improve security, increase performance, and make it easier to manage the network

Each subnet must have a unique address range – cannot overlap with other subnets in the vnet in the subscription

Plan IP Addressing

Private IP addresses - used within an Azure virtual network (VNet), and your on-premises network, when you use a VPN gateway or ExpressRoute circuit to extend your network to Azure

Public IP addresses - used for communication with the Internet, including Azure public-facing services

Associate Public IP Addresses

Public IP addresses	IP address association	Dynamic	Static
Virtual Machine	NIC	Yes	Yes
Load Balancer	Front-end configuration	Yes	Yes
VPN Gateway	Gateway IP configuration	Yes	Yes*
Application Gateway	Front-end configuration	Yes	Yes*

A public IP address resource can be associated with virtual machine network interfaces, internet-facing load balancers, VPN gateways, and application gateways

*Static IP addresses only available on certain SKUs.

Associate Private IP Addresses

Private IP Addresses	IP address association	Dynamic	Static
Virtual Machine	NIC	Yes	Yes
Internal Load Balancer	Front-end configuration	Yes	Yes
Application Gateway	Front-end configuration	Yes	Yes

Dynamic (default). Azure assigns the next available unassigned or unreserved IP address in the subnet's address range

Static. You select and assign any unassigned or unreserved IP address in the subnet's address range

Lesson 5: Configure Network Security Groups

Configure Network Security Groups Introduction

Implement Network Security Groups (NSG)

Determine NSG Rules

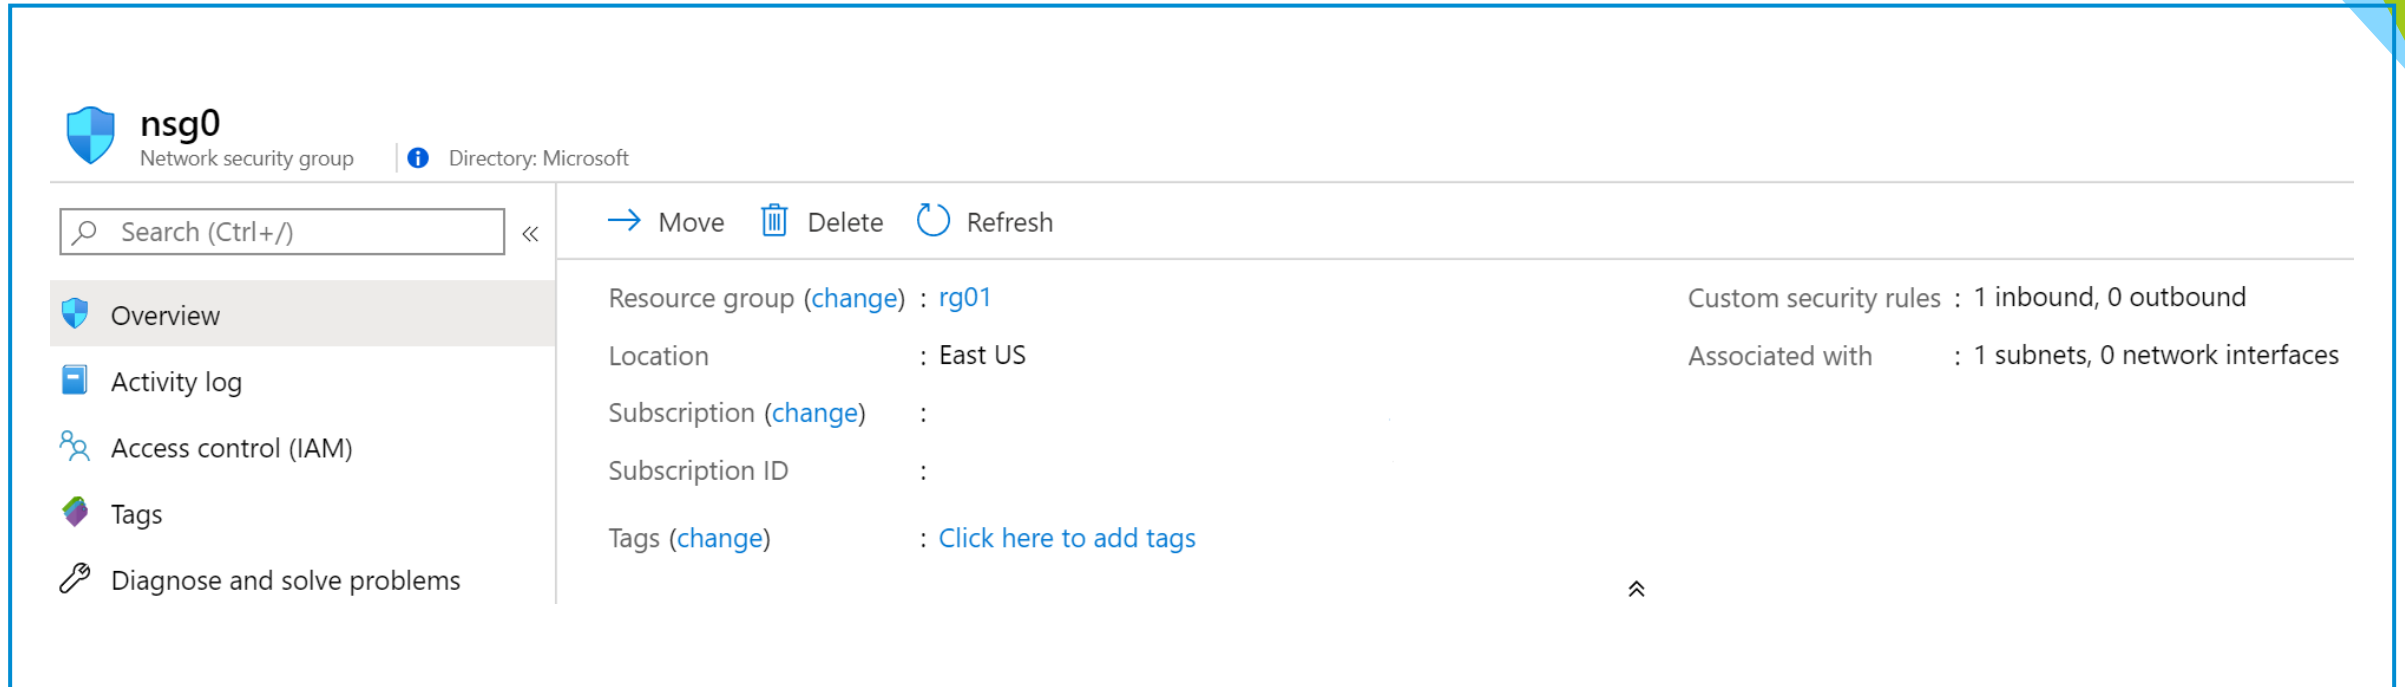

Determine NSG Effective Rules

Create NSG Rules

Implement Network Security Groups

The screenshot displays the Azure portal interface for a Network Security Group (nsg0). The left sidebar contains navigation links: Overview (selected), Activity log, Access control (IAM), Tags, and Diagnose and solve problems. The main content area shows the following details:

- Resource group (change) :** rg01
- Location :** East US
- Subscription (change) :**
- Subscription ID :**
- Tags (change) :** [Click here to add tags](#)
- Custom security rules :** 1 inbound, 0 outbound
- Associated with :** 1 subnets, 0 network interfaces

At the top of the main content area, there are action buttons: Move, Delete, and Refresh. A search bar is also present at the top left of the main content area.

Limits network traffic
to resources in a
virtual network

Lists the security rules
that allow or deny
inbound or outbound
network traffic

Associated
to a subnet or a
network interface

Can be associated
multiple times

Determine NSG Rules

Inbound security rules

Priority	Name	Port	Protocol	Source	Destination	Action
100	⚠ RDP_Inbound	3389	Any	Any	Any	✅ Allow
65000	AllowVnetInBound	Any	Any	VirtualNetwork	VirtualNetwork	✅ Allow
65001	AllowAzureLoadBalancerInBound	Any	Any	AzureLoadBalancer	Any	✅ Allow
65500	DenyAllInBound	Any	Any	Any	Any	❌ Deny

Outbound security rules

Priority	Name	Port	Protocol	Source	Destination	Action
65000	AllowVnetOutBound	Any	Any	VirtualNetwork	VirtualNetwork	✅ Allow
65001	AllowInternetOutBound	Any	Any	Any	Internet	✅ Allow
65500	DenyAllOutBound	Any	Any	Any	Any	❌ Deny

Security rules in NSGs enable you to filter network traffic that can flow in and out of virtual network subnets and network interfaces

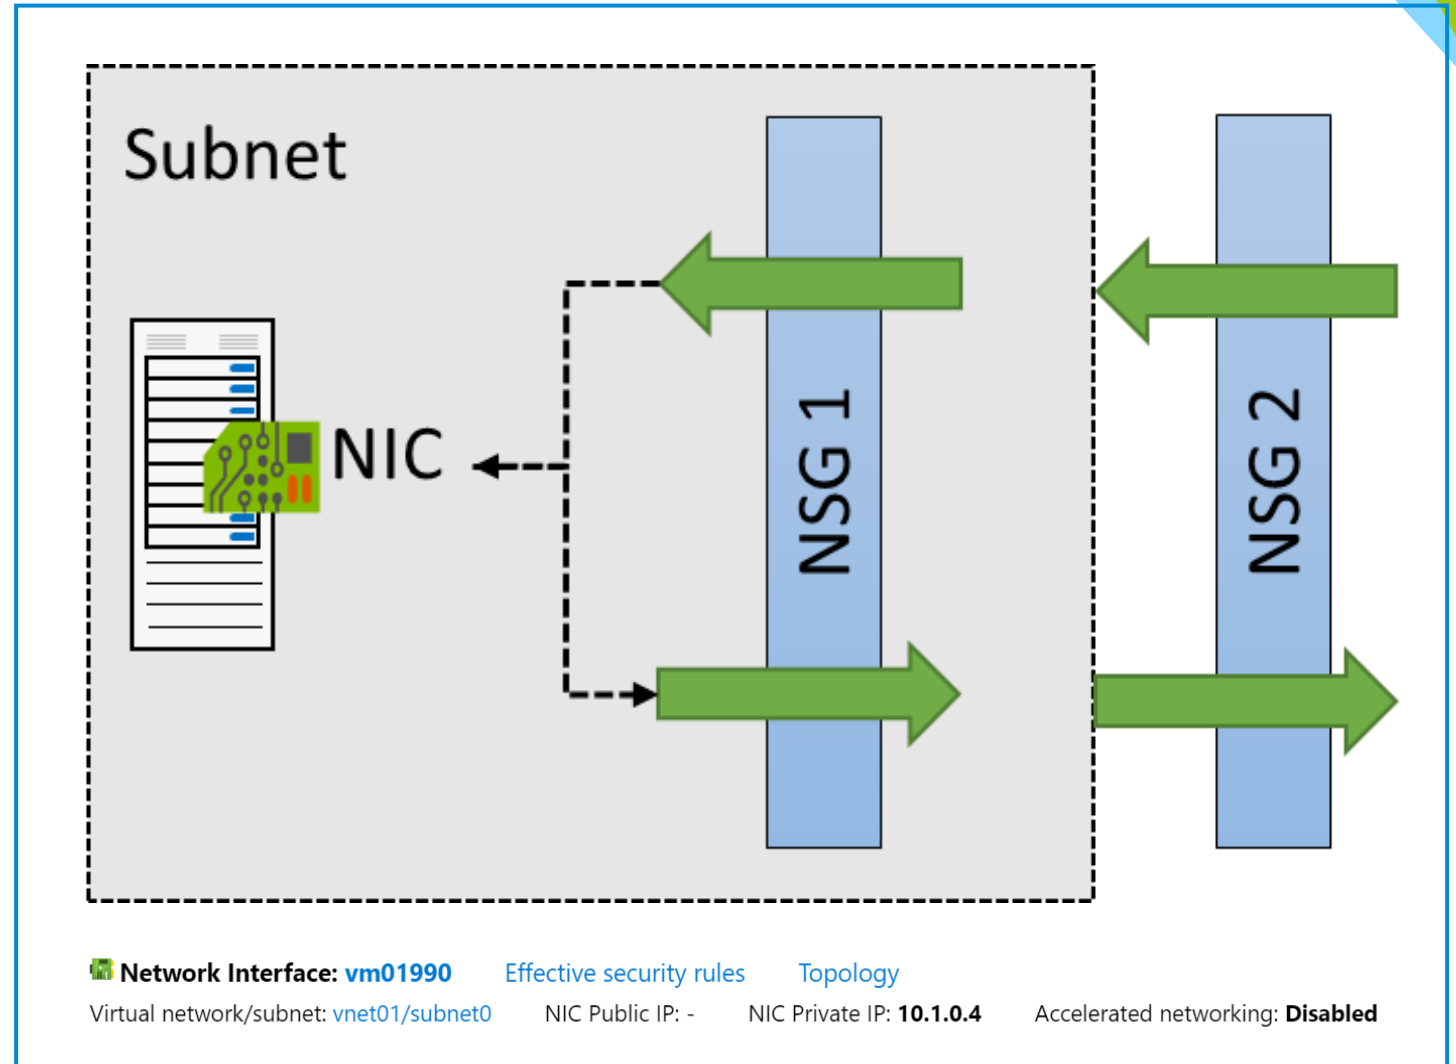

There are default security rules. You cannot delete the default rules, but you can add other rules with a higher priority

Determine NSG Effective Rules

NSGs are evaluated independently for the subnet and NIC

An “allow” rule must exist at both levels for traffic to be admitted

Use the Effective Rules link if you are not sure which security rules are being applied

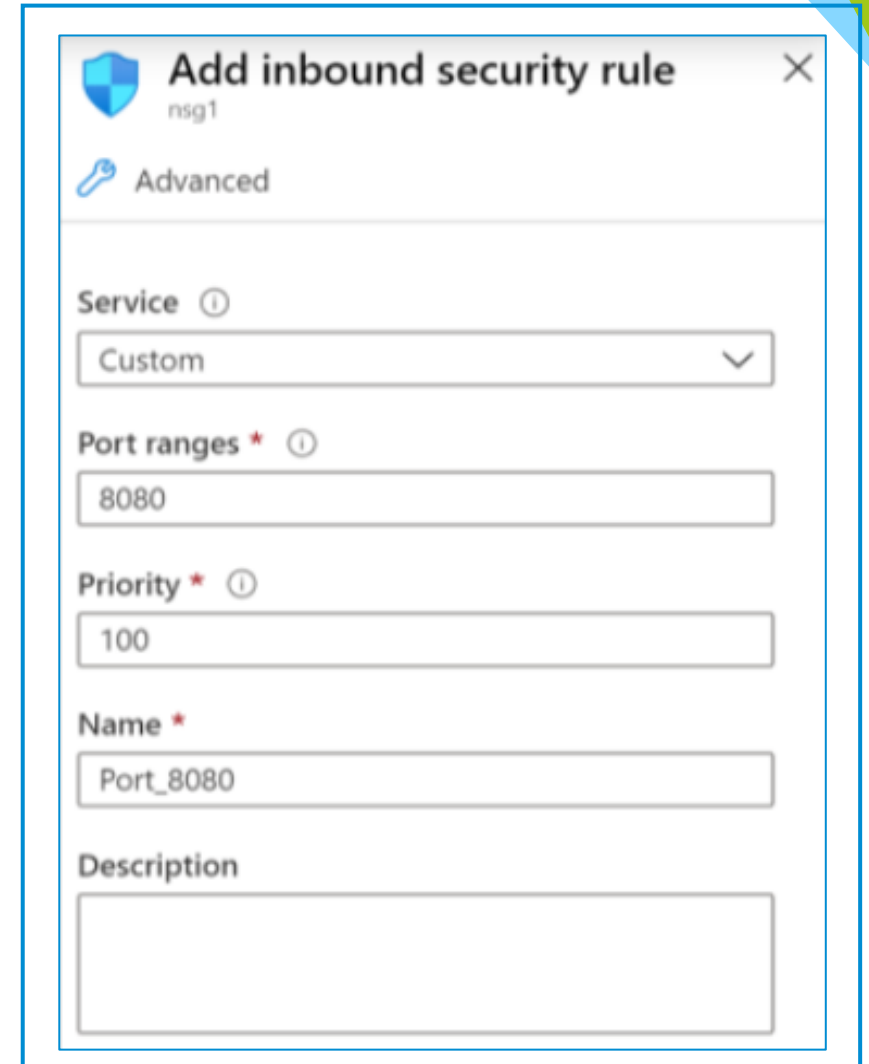

Create NSG rules

Select from a large variety of services

Service – The destination protocol and port range for this rule

Port ranges – Single port or multiple ports

Priority – The lower the number, the higher the priority

Add inbound security rule ✕

Lesson 6: Configure Azure DNS

Configure Azure DNS

Identify Domains and Custom Domains

Verify Custom Domain Names

Create Azure DNS Zones

Delegate DNS Domains

Add DNS Record Sets

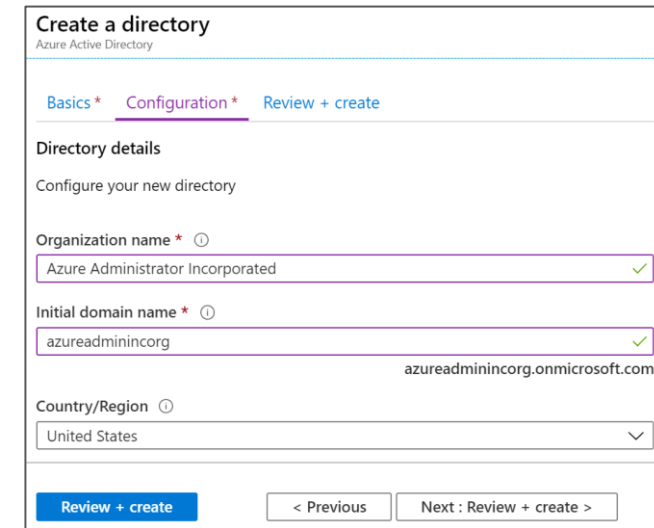

Identity Domains and Custom Domains

When you create an Azure subscription an Azure AD domain is created for you

The domain has initial domain name in the form *domainname.onmicrosoft.com*

You can customize/change the name

After the custom name is added it must be verified (next topic)

Create a directory
Azure Active Directory

[Basics *](#) [Configuration *](#) [Review + create](#)

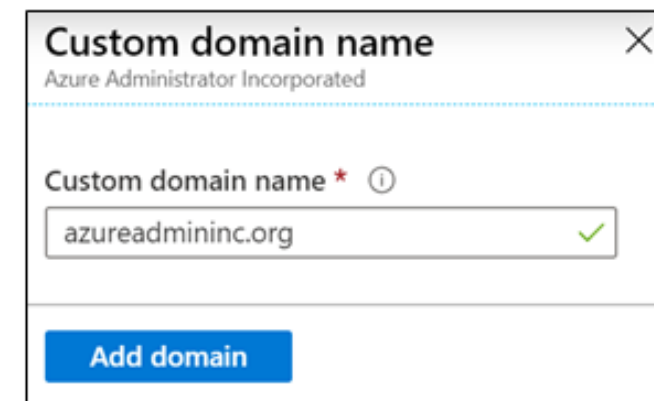

Directory details
Configure your new directory

Organization name * ⓘ
Azure Administrator Incorporated ✓

Initial domain name * ⓘ
azureadminincorg ✓
azureadminincorg.onmicrosoft.com

Country/Region ⓘ
United States ▼

[Review + create](#) [< Previous](#) [Next : Review + create >](#)

Custom domain name X
Azure Administrator Incorporated

Custom domain name * ⓘ
azureadmininc.org ✓

[Add domain](#)

Verify Custom Domain Names

Verification demonstrates ownership of the domain name

Add a DNS record (MX or TXT) that is provided by Azure into your company's DNS zone

Azure will query the DNS domain for the presence of the record

This could take several minutes or several hours

azureadmininc.org

Custom domain name

Delete

Got feedback?

To use azureadmininc.org with your Azure AD, create a new TXT record with your domain name registrar using the info below.

Record type

TXT

MX

Alias or host name

@

Destination or points to address

MS=ms79094380

TTL

3600

[Share these settings via email](#)

Verification will not succeed until you have configured your domain with your registrar as described above.

Create Azure DNS Zones

A DNS zone hosts the DNS records for a domain

The name of the zone must be unique within the resource group

Where multiple zones share the same name, each instance is assigned different name server addresses

Root/Parent domain is registered at the registrar and pointed to Azure NS

Create DNS zone

BasicsTagsReview + create

A DNS zone is used to host the DNS records for a particular domain. For example, the domain 'contoso.com' may contain a number of DNS records such as 'mail.contoso.com' (for a mail server) and 'www.contoso.com' (for a web site). Azure DNS allows you to host your DNS zone and manage your DNS records, and provides name servers that will respond to DNS queries from end users with the DNS records that you create. [Learn more.](#)

[Download a template for automation](#)

Delegate DNS Domains

When delegating a domain to Azure DNS, you must use the name server names provided by Azure DNS – use all four

Once the DNS zone is created, update the parent registrar

For child zones, register the NS records in the parent domain

The screenshot displays the Azure portal interface for a DNS zone named **azureadmininc.org**. The interface includes a header with the DNS icon and the zone name, followed by a toolbar with actions: **+ Record set**, **→ Move**, **🗑️ Delete zone**, and **🔄 Refresh**. The main content area is divided into two columns. The left column lists configuration details: **Resource group** (with a [change](#) link) set to **rg-dns**, **Subscription** (with a [change](#) link) set to **MSDN Platforms Subscription**, and **Subscription ID**. The right column lists the four required name servers: **Name server 1** (**ns1-02.azure-dns.com.**), **Name server 2** (**ns2-02.azure-dns.net.**), **Name server 3** (**ns3-02.azure-dns.org.**), and **Name server 4** (**ns4-02.azure-dns.info.**). At the bottom left, there is a **Tags** section (with a [change](#) link) and a [Click here to add tags](#) link.

azureadmininc.org DNS zone	
+ Record set → Move 🗑️ Delete zone 🔄 Refresh	
Resource group (change) rg-dns	Name server 1 ns1-02.azure-dns.com.
Subscription (change) MSDN Platforms Subscription	Name server 2 ns2-02.azure-dns.net.
Subscription ID	Name server 3 ns3-02.azure-dns.org.
	Name server 4 ns4-02.azure-dns.info.
Tags (change) Click here to add tags	

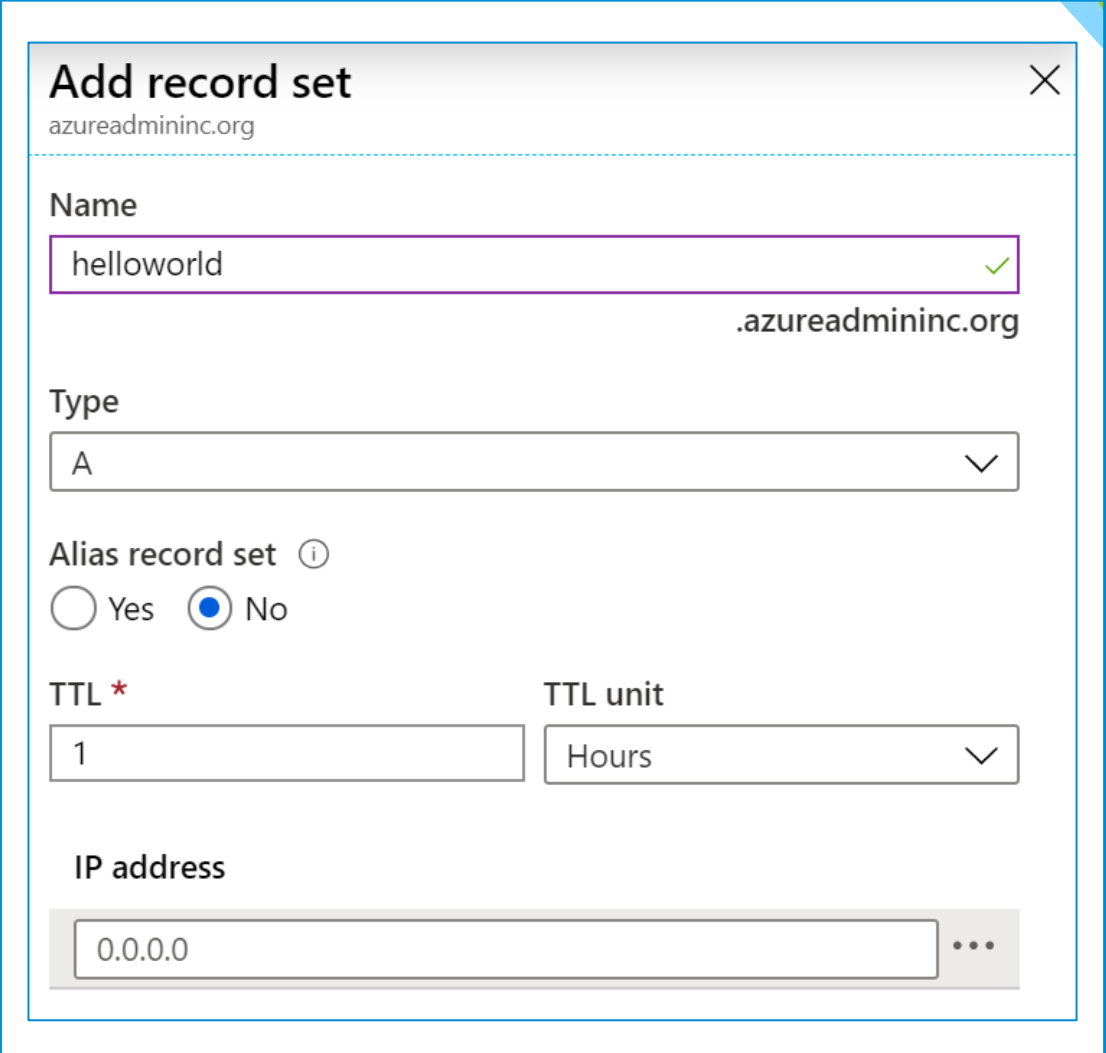

Add DNS Record Sets

A record set is a collection of records in a zone that have the same name and are the same type

You can add up to 20 records to any record set

A record set cannot contain two identical records

Changing the drop-down Type, changes the information required

The screenshot shows a 'Add record set' dialog box for the domain 'azureadmininc.org'. The 'Name' field contains 'helloworld' with a green checkmark. The 'Type' is set to 'A'. The 'Alias record set' option is set to 'No'. The 'TTL' is '1' and the 'TTL unit' is 'Hours'. The 'IP address' field contains '0.0.0.0' with a three-dot menu icon to its right.

Lesson 7: Configure VNet Peering

Configure VNet Peering Introduction

Determine VNet Peering Uses

Determine Gateway Transit and Connectivity Needs

Create VNet Peering

Determine Service Chaining Uses

Demonstration – VNet Peering

Summary and Resources

Determine VNet Peering Uses

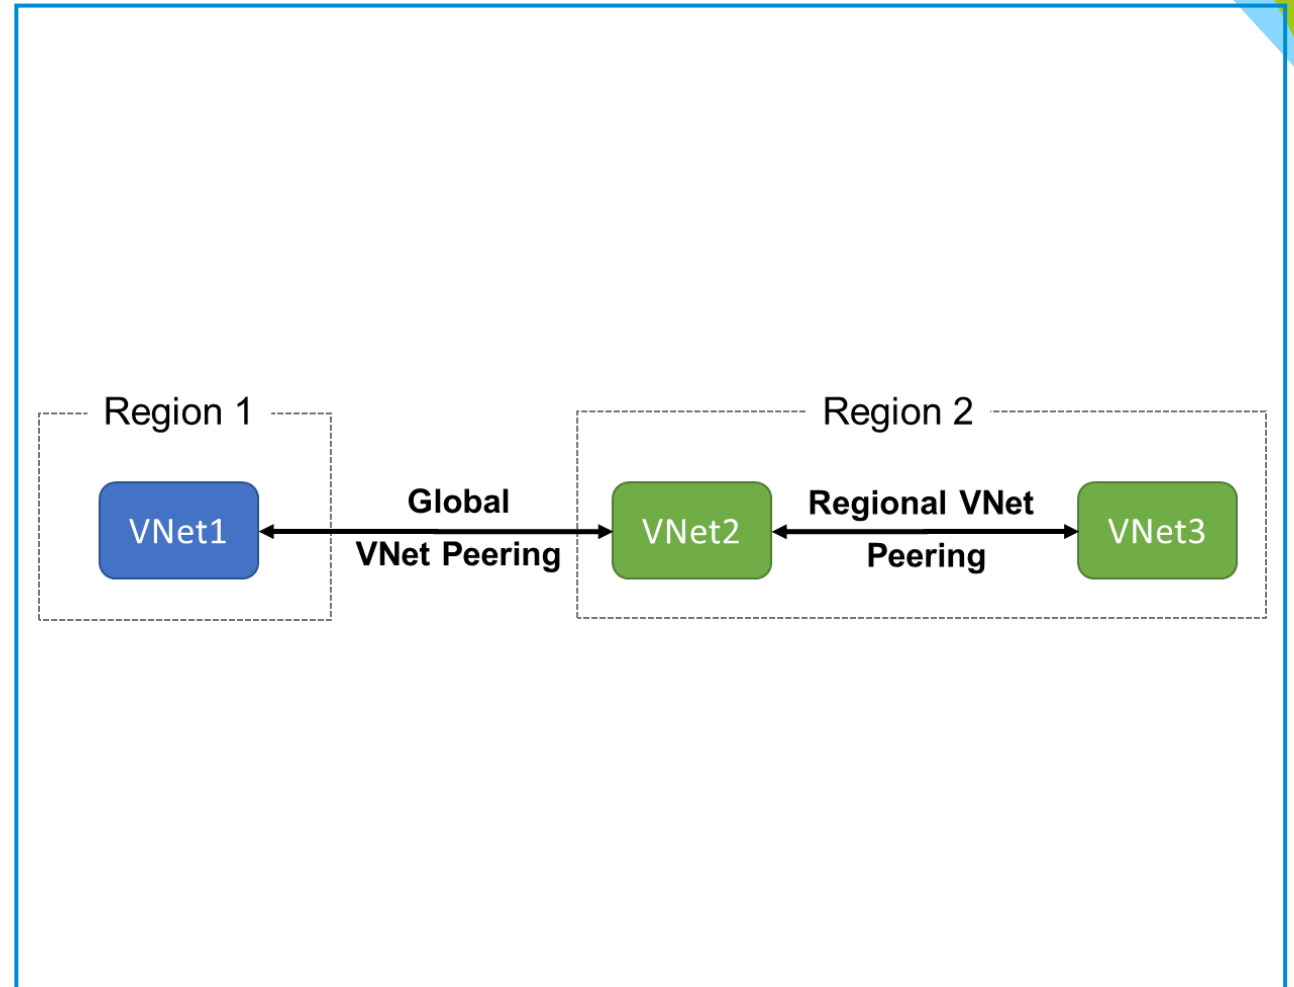

VNet peering connects two Azure virtual networks

Two types of peering: Regional and Global

Peered networks use the Azure backbone for privacy and isolation

You can peer across subscriptions and tenants

Easy to setup, seamless data transfer, and great performance

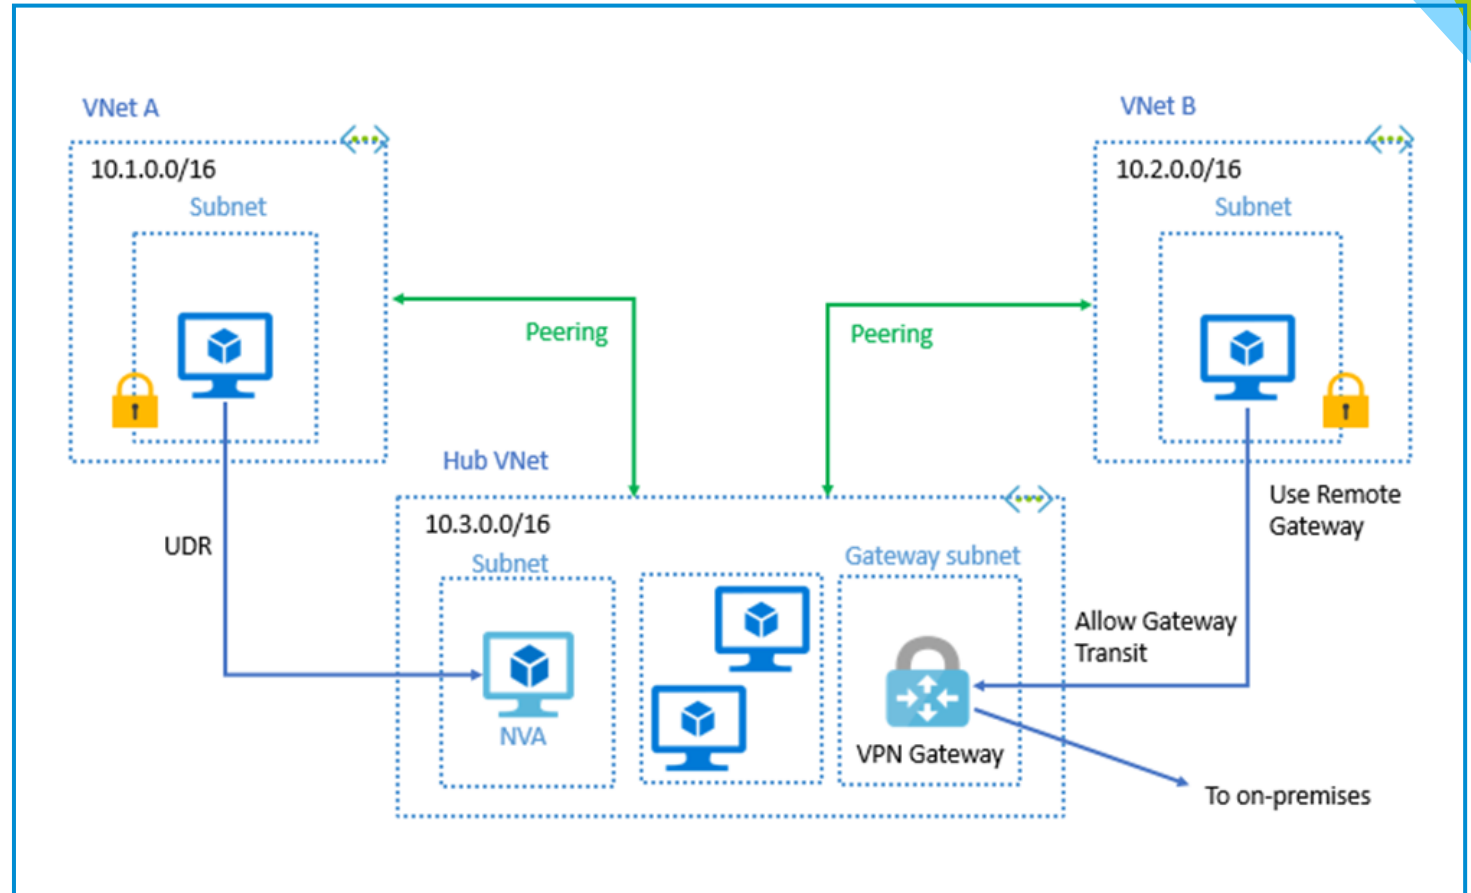

Determine Gateway Transit and Connectivity Needs

Gateway transit allows peered virtual networks to share the gateway and get access to resources

No VPN gateway is required in the peered virtual network

Default VNet peering provides full connectivity

IP address spaces of connected networks can't overlap

Create VNet Peering

Allow virtual network access settings

Configure forwarded traffic settings

This virtual network

Peering link name *

Traffic to remote virtual network ⓘ

- ☒ Allow (default)
- ☐ Block all traffic to the remote virtual network

Traffic forwarded from remote virtual network ⓘ

- ☒ Allow (default)
- ☐ Block traffic that originates from outside this virtual network

Virtual network gateway ⓘ

- ☐ Use this virtual network's gateway
- ☐ Use the remote virtual network's gateway
- ☒ None (default)

Remote virtual network

Peering link name *

Determine Service Chaining Uses

Leverage user-defined routes and service chaining to implement custom routing

Implement a VNet hub with a network virtual appliance or a VPN gateway

Service chaining enables you to direct traffic from one virtual network to a virtual appliance, or virtual network gateway, in a peered virtual network, through user-defined routes

Lesson 8: Configure Network Routing

Configure Network Routing and Endpoints Introduction

Review System Routes

Identify User-Defined Routes

Examine a Routing Example

Determine Service Endpoint Uses

Determine Service Endpoint Services

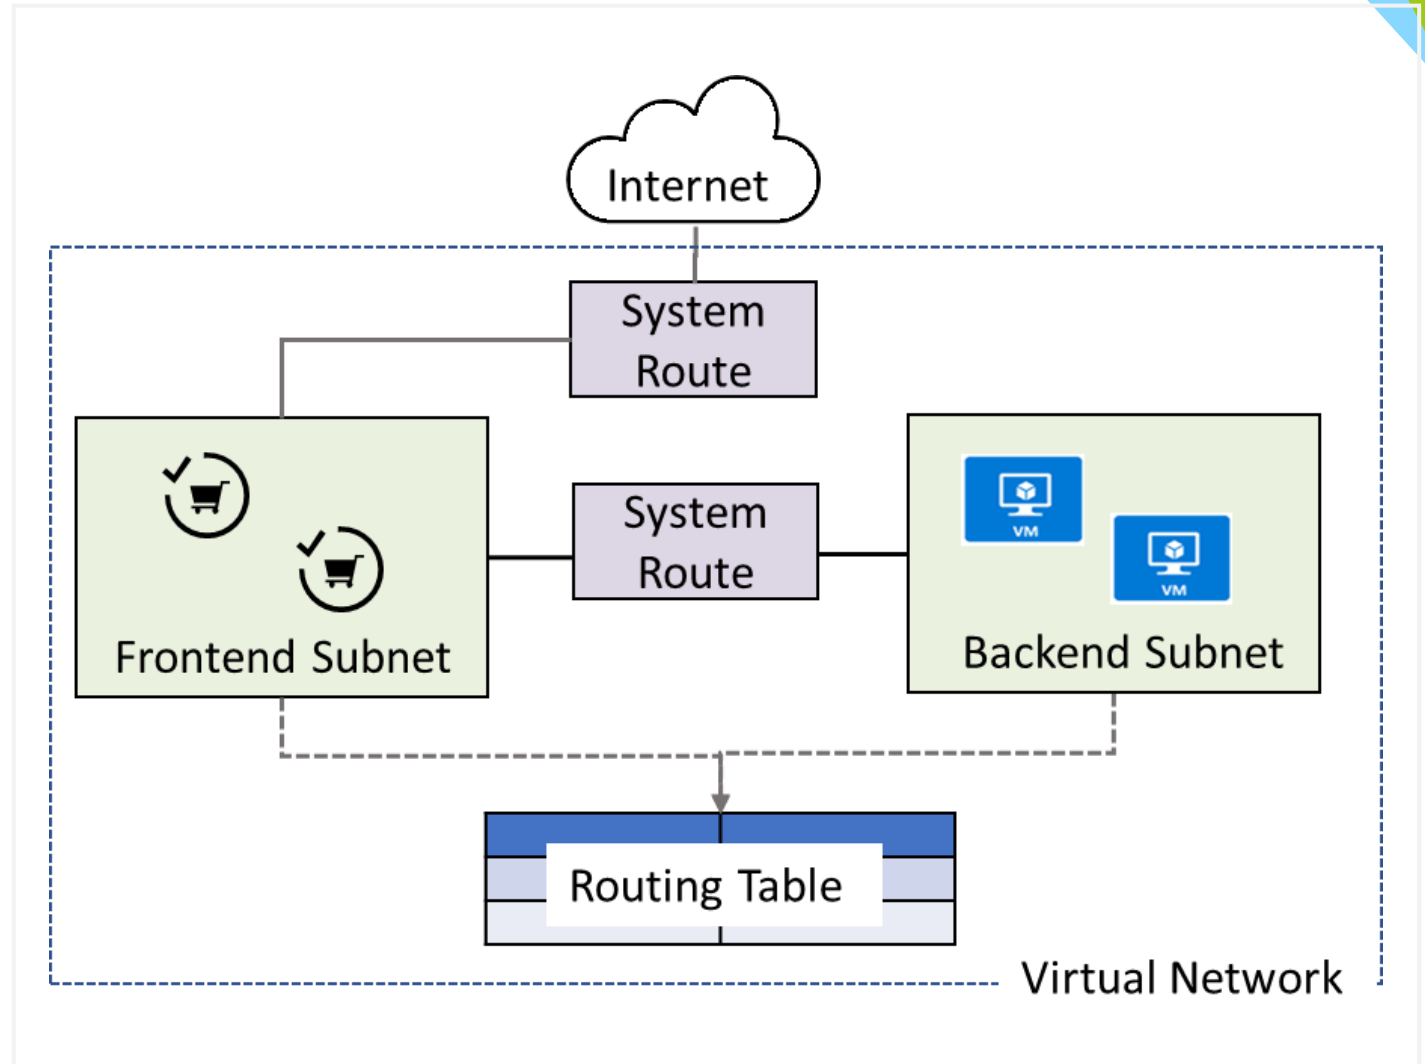

Identify Private Link Uses

Review System Routes

System routes direct network traffic between virtual machines, on-premises networks, and the Internet:

- Traffic between VMs in the same subnet
- Between VMs in different subnets in the same virtual network
- Data flow from VMs to the Internet
- Communication between VMs using a VNet-to-VNet VPN
- Site-to-Site and ExpressRoute communication through the VPN gateway

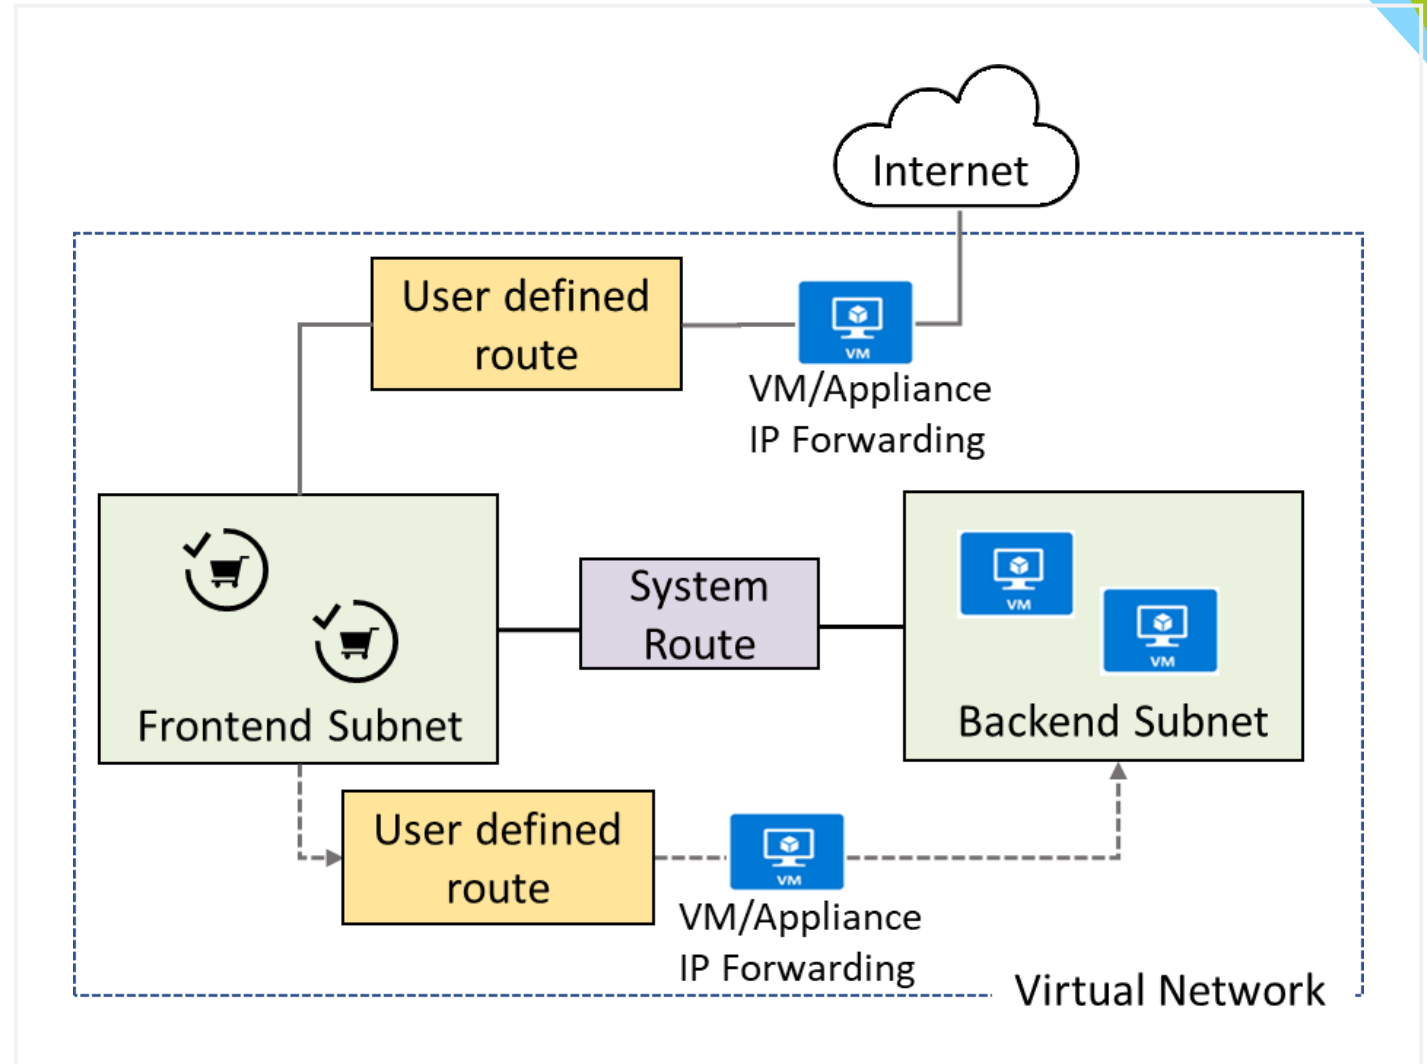

Identify User-Defined Routes

A route table contains a set of rules, called routes, that specifies how packets should be routed in a virtual network

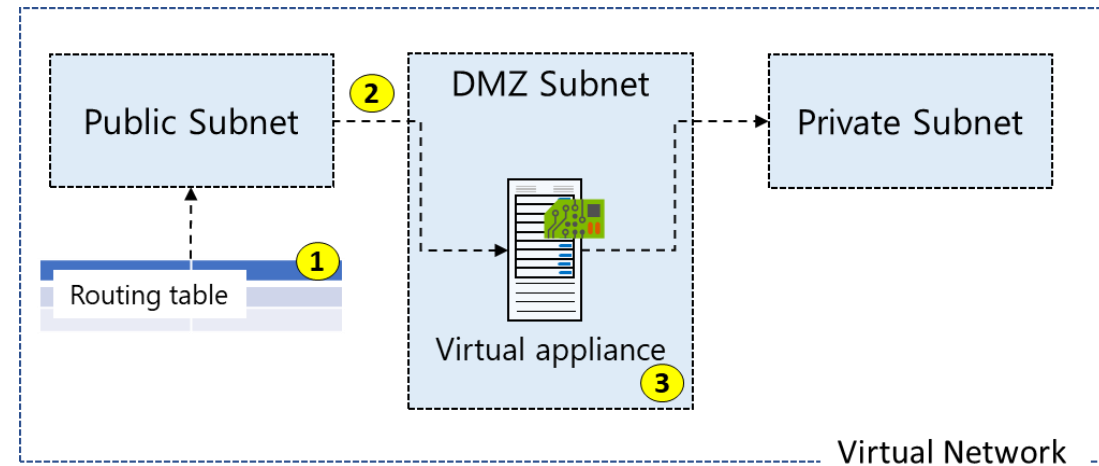

User-defined routes are custom routes that control network traffic by defining routes that specify the next hop of the traffic flow

The next hop can be a virtual network gateway, virtual network, internet, or virtual appliance

Examine a Routing Example

All traffic coming into the public subnet and headed for the private subnet must go through the virtual network appliance

Create route table 1

You can add routes to this table after it's created.

Lesson 9: Configure Azure Load Balancer

Configure Azure Load Balancer Introduction

Determine Azure Load Balancer Uses

Implement a Public Load Balancer

Implement an Internal Load Balancer

Determine Load Balancer SKUs

Create Backend Pools

Create Load Balancer Rules

Configure Session Persistence

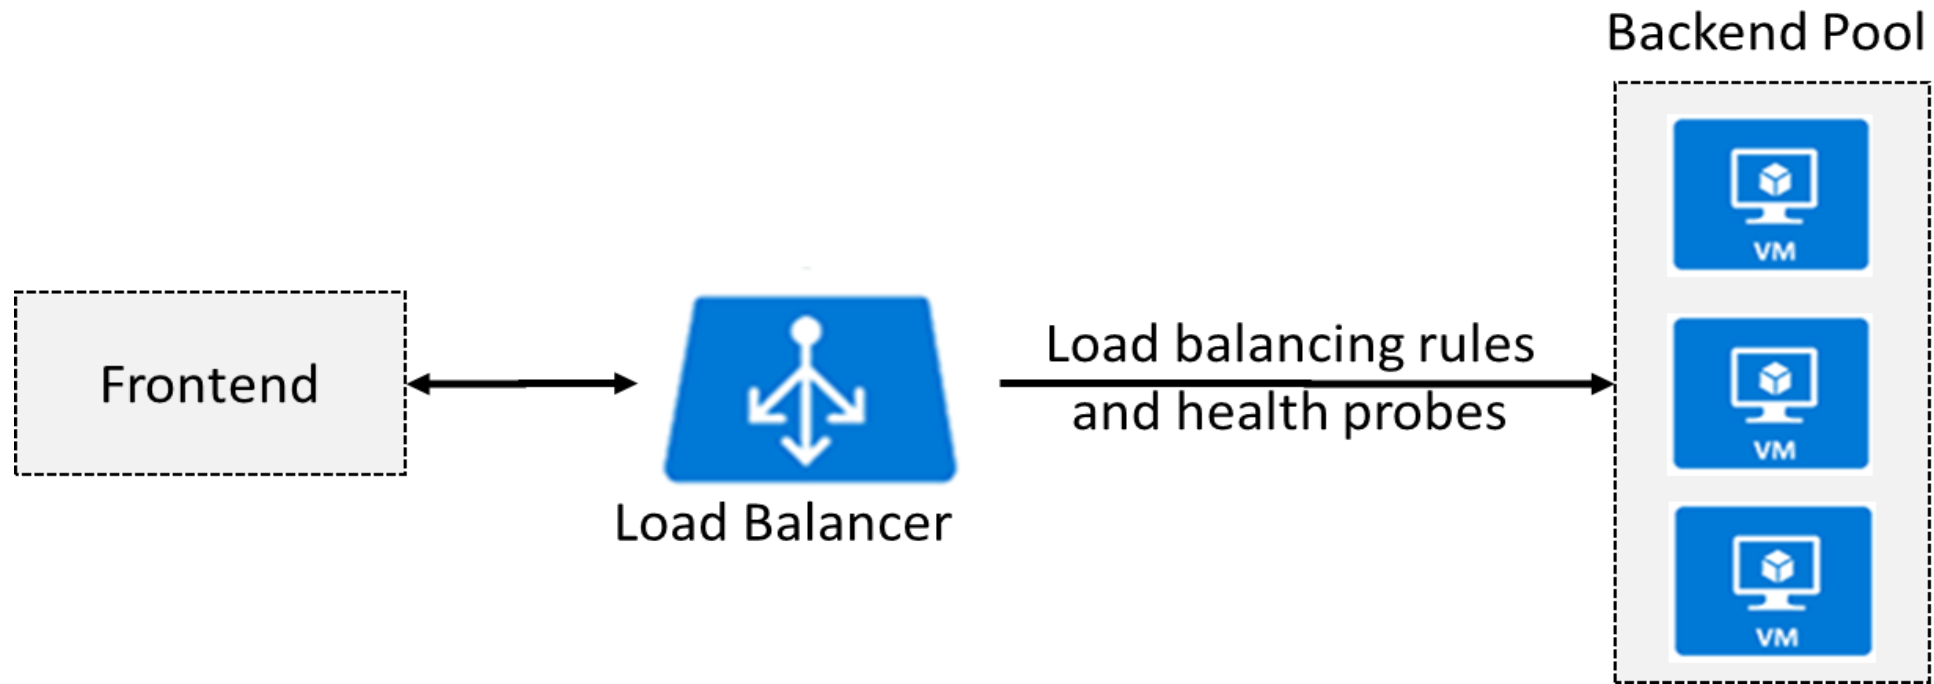

Create Health Probes

Summary and Resources

Determine Azure Load Balancer Uses

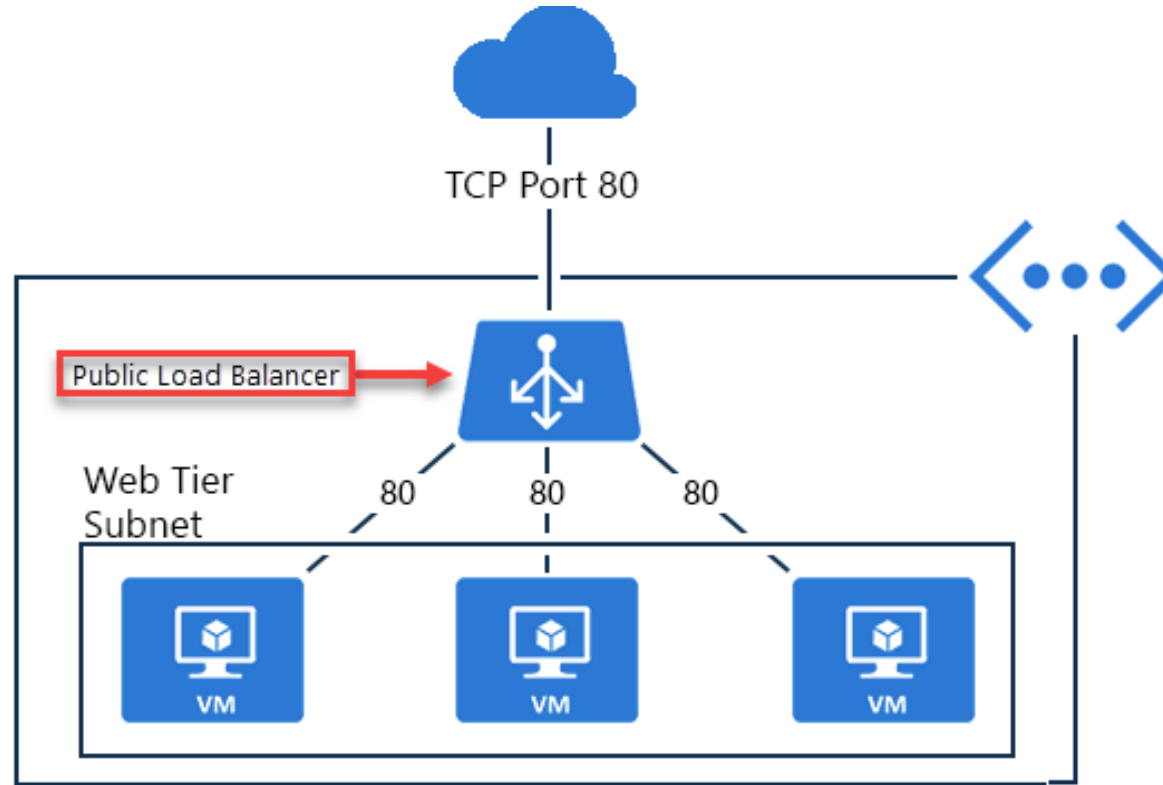

Distributes inbound traffic to backend resources using load-balancing rules and health probes

Can be used for both inbound/outbound scenarios

Two types: Public and Internal

Implement a Public Load Balancer

Maps public IP addresses and port number of incoming traffic to the VM's private IP address and port number, and vice versa

Apply load balancing rules to distribute traffic across VMs or services

Implement an Internal Load Balancer

Directs traffic only to resources inside a virtual network or that use a VPN to access Azure infrastructure

Frontend IP addresses and virtual networks are never directly exposed to an internet endpoint

Enables load balancing within a virtual network, for cross-premises virtual networks, for multi-tier applications, and for line-of-business applications

Determine Load Balancer SKUs

Feature	Basic SKU	Standard SKU
Backend pool	Up to 300 instances	Up to 1000 instances
Health probes	TCP, HTTP	TCP, HTTP, HTTPS
Availability zones	Not available	Zone-redundant and zonal frontends for inbound and outbound traffic
Multiple frontends	Inbound only	Inbound and outbound
Secure by default	Open by default. NSG optional.	Closed to inbound flows unless allowed by a NSG. Internal traffic from the virtual network to the internal load balancer is allowed.
SLA	Not available	99.99%

Instance details

Create Backend Pools

SETTINGS

Backend pools

★ Name

cesbackendpool

Associated to ⓘ

Unassociated

Unassociated

Availability set

Single virtual machine

Virtual machine scale set

SKU	Backend pool endpoints
Basic SKU	VMs in a single availability set or VM scale set
Standard SKU	Any VM in a single virtual network, including a blend of VMs, availability sets, and VM scale sets

To distribute traffic, a back-end address pool contains the IP addresses of the virtual NICs that are connected to the load balancer

Create Load Balancer Rules

Maps a frontend IP and port combination to a set of backend pool and port combination

Rules can be combined with NAT rules

A NAT rule is explicitly attached to a VM (or network interface) to complete the path to the target

Add load balancing rule
